This study examined the impact of corporate social responsibility (CSR) communication on social media on green buying behavior in Pakistan's banking sector, focusing on the mediating role of ecological concern and the moderating role of green advertising. We recruited a sample of 392 banking customers and conducted structural equation modeling using partial least squares. The findings revealed that CSR communication significantly predicted ecological concern, which, in turn, positively predicted green buying behavior. Green advertising further amplified the relationship between CSR and ecological concern. This study's findings emphasize the importance of leveraging social media for effective CSR communication and strategic green advertising to promote environmental sustainability. Practical recommendations include banks using social media to communicate CSR initiatives and designing targeted green advertising campaigns.

Keywords

corporate social responsibility, social media, ecological concern, green advertising, green buying behavior, banking industry

Article Highlights

- Corporate social responsibility communication on social media significantly enhanced green buying behavior.
- Ecological concern mediated the relationship between corporate social responsibility and green buying behavior.
- Green advertising amplified the influence of corporate social responsibility on consumers' ecological concerns.

Modern organizations have become increasingly customer oriented, largely due to the evolving nature of customer interactions with organizations over the years (Ahmad et al., 2024). With the advancement of social media sites such as Facebook, X (formerly Twitter), Instagram, and LinkedIn, marketing in contemporary society has undergone a significant transformation, enabling more targeted, interactive, and widespread communication (Zhou et al., 2023). These platforms are not only used for advertising and image creation but also to directly interact with customers (Li et al., 2024). With the progression of the digital age, corporate social responsibility has become an essential aspect of the sustainable management of businesses, with firms employing social media to announce their environmental and social causes (Zhang et al., 2021). This is because by addressing environmental and social factors, businesses can be in a position to gain the trust of their customers and even create a positive image (Ahmad, Ahmad, et al., 2024). This is crucial for corporate image and for shaping green consumer behavior in Pakistan's banking industry, where

environmental pollution is high (Ahmad, Mahmood, et al., 2021). The combination of digital communication and sustainability emphasizes that customers are the key to organizational success and a sustainable future (Ahmad, Naveed, et al., 2021).

We aimed to contribute to discussions of the relationship between corporate social responsibility and consumer behavior from the perspective of social media platforms, paying special attention to how corporate social responsibility communication by banks on social media could determine customers' green buying behavior. *Green advertising* specifically promotes a company's commitment to environmental sustainability, focusing on eco-friendly products or services (Kwon et al., 2024). Unlike broader corporate social responsibility communication, green advertising is a targeted effort to influence consumer behavior toward sustainability (Ahmad, Naveed, et al., 2021). This study focused on banks' green advertising on social media, examining how these efforts differ from general corporate social responsibility communication and impact consumer green buying behavior. Additionally, green advertising may enhance the effectiveness of corporate social responsibility initiatives by drawing more attention to them, making them more persuasive and effective.

We chose the banking industry of Pakistan, with its critical role in the economy and ability to shape trends through a huge customer base, as the focal point of this research. Although understanding of the significance of corporate social responsibility in different companies is increasing (Ahmad, Samad, & Han, 2024), there still remains a gap in knowledge as to how corporate social responsibility communication directly affects consumer buying behavior within a banking context, especially on social media platforms. Previous studies have often overlooked service industries like banking, where, according to Gupta, Nawaz, Tripathi, et al. (2021), trust and relationship building are crucial. This makes corporate social responsibility communication particularly impactful but underexplored in studies. A limited number of researchers, such as Liu et al. (2023), have conducted studies on this subject but there is still a need for insight in the various aspects of corporate social responsibility communication, ecological concern, and green advertising, and their effect on consumer behavior. We aimed to fill these gaps by exploring the impact of corporate social responsibility messages on social media on consumers' ecological concern and, therefore, green buying behavior. Further, we explored green advertising as a moderator of the impact of corporate social responsibility announcements on stakeholder responses. Besides contributing to theoretical knowledge of the corporate social responsibility–consumer behavior connection, this research provides practical implications for banks that are interested in implementing an appropriate corporate social responsibility communication approach.

The Current Study

The positive connection between CSR and green consumer behavior is widely supported (Guan et al., 2023; Han et al., 2020; Murtaza et al., 2021; Sun et al., 2020). *Corporate social responsibility* (CSR) means that companies prioritize the good of society and nature over purely business motives (Ahmad, Samad, & Mahmood, 2024). *Green buying behavior* is the inclination of the customers toward eco-friendly products and or services. The impact of CSR communication on consumer behavior has been shown in traditional media (Vogler & Eisenegger, 2021), but its effect on social media, especially in the banking industry, has not been studied. Gupta, Nawaz, Alfalah, et al. (2021) suggested that social media can enhance CSR communication by increasing engagement and trust. Thus, this study explored how CSR on social media influences green buying behavior in the banking sector.

We used the theory of planned behavior (TPB) as the basis of our study, as it explains how attitudes, subjective norms, and behavioral perceptions impact behavior (Gansser & Reich, 2023). The TPB postulates that intentions are the precursors of behaviors (Ajzen, 1991). In our research, CSR communication may make a positive difference in opinion, reputation, and information about sustainability and facilitate green buying. Hence, we proposed the following hypothesis:

Hypothesis 1: Corporate social responsibility communication on social media will positively predict customers' green buying behavior.

Efficient CSR communication can raise ecological concern among customers to be more environmentally conscious through the provision of information about consumer choices and the sustainability efforts made by companies (Rusyani et al., 2021). We believed being exposed to CSR messages that advocate for green responsibility and environment conservation would bring about more concern about and willingness to engage in environmental protection. Ecological concern by consumers may cause them to choose green products and/or services. Greater participation of environmentally concerned community members may mean they will make more eco-friendly purchases. The relationships between CSR communication, ecological concern, and green purchasing demonstrate how CSR initiatives can theoretically promote environmental awareness and encourage eco-friendly consumer behavior.

Ecological concern mediates the relationship between CSR communication and green buying behavior (Tao et al., 2022). Social media CSR communication emphasizes environmental issues and sustainability, which heightens consumer concern and influences their attitude and intention toward green buying (Saif et al., 2024). From the perspective of the TPB, CSR communication affects attitudes and norms related to sustainability, with ecological concern acting as a mediator of environmentally friendly buying behavior (Xing et al., 2023). This integration of the TPB and mediation effects explains how CSR communication stimulates sustainable consumer behavior (Bekmeier-Feuerhahn et al., 2017). Thus, we proposed the following hypotheses:

Hypothesis 2: Corporate social responsibility communication on social media will positively predict the ecological concern of customers.

Hypothesis 3: Ecological concern will positively predict customers' green buying behavior.

Hypothesis 4: Ecological concern will mediate the relationship between corporate social responsibility communication on social media and customers' green buying behavior.

As social media is integrated into green advertising, it makes CSR communication much more effective (Gupta, Nawaz, Tripathi, et al., 2021). Green advertising on social media highlights environmental advantages and thus improves the visibility, credibility, and engagement of consumers with sustainability initiatives (Kwon et al., 2024). Platforms such as Facebook, Instagram, and X (formerly Twitter) are endowed with live participation functions and targeted messages; thus, they render green campaigns more effective (Luo et al., 2020). When consumers view green advertisements, their ecological concerns are reaffirmed; thus, they become more receptive to CSR messages and more inclined to practice green buying behavior (Thakkar, 2021). Therefore, as evidenced by the ability of CSR communication to raise ecological concern and encourage eco-friendly purchases, green advertising on social media can be said to strengthen this connection by delivering consistent and compelling environmental messages that resonate with environmentally conscious consumers. This highlights the potential significance of green advertising on social media in creating a meaningful effect of CSR on the buying behavior of consumers. Thus, we proposed the following hypothesis:

Hypothesis 5: Green advertising on social media will moderate the mediating effect of ecological concern on the relationship between corporate social responsibility communication on social media and customers' green buying behavior, such that the relationship will be stronger when green advertising is more prevalent.

Method

Participants and Procedure

Participants in this research were customers of different banks in Pakistan. Data were gathered with a structured questionnaire, which was distributed using online and physical channels. Participants were invited to join via social media, email, and visits to bank branches. They were made aware of the study's aim, privacy policy, and that they could withdraw at any time. Informed consent was obtained before participating. We distributed 600 questionnaires, of which 419 were completed. Following data cleaning, 27 questionnaires were discarded due to incomplete answers, leaving 392 valid responses, resulting in a response rate of approximately 65%. Banks were selected based on the extent of their social media activity, measured by the frequency of and engagement with their posts, as well as their involvement in CSR projects, which were evaluated based on publicly available reports and documented initiatives, to ensure the relevance of their contributions to the study. Table 1 shows the demographic profile of the respondents.

Table 1. *Demographic Data of Respondents*

Demographic category		<i>n</i>	%
Gender	Men	214	54.60
	Women	178	45.40
Age (years)	18–24	90	22.90
	25–34	162	41.30
	35–44	88	22.40
	45–54	32	8.20
	≥ 55	20	5.10
Education level	High school	34	8.70
	Undergraduate	128	32.70
	Graduate	174	44.40
	Postgraduate	56	14.30

Measures

The questionnaire was presented in English and items were rated on a 5-point Likert scale ranging from 1 (*strongly disagree*) to 5 (*strongly agree*).

Corporate Social Responsibility Communication on Social Media

We sourced items measuring CSR communication on social media from Fatma et al. (2020), who had modified the scales for social media from Brown and Dacin (1997) and Klein and Dawar (2004). A sample item is “When I see this bank’s social media CSR communication, I feel this bank does not have a detrimental effect on the environment.”

Green Advertising

We assessed green advertising using four items from Herman et al. (2021), which we modified to fit the context of social media. A sample item is “I usually get green reminders from this bank on social media about environmental issues.”

Ecological Concern

We assessed ecological concern with four items from Goh and Balaji (2016). A sample item is “I am willing to make sacrifices to protect the environment.”

Green Buying Behavior

We assessed green buying behavior using four items from Jabeen et al. (2023). A sample item is “I prefer purchasing products/services that are eco-friendly.”

To minimize methodological bias, participants were assured of their anonymity and the confidentiality of their responses. Additionally, we used different question formats (e.g., positively and negatively worded items) to reduce response bias and ensure the reliability of the data collected. Harman’s single-factor test confirmed that no single factor explained more than the critical threshold of 40% of the variance, with the first factor accounting for only 32%, thus ruling out common method bias as a serious concern in this study.

Results

We utilized SMART-PLS for data analysis to evaluate the factor loadings of the measured variables and variance inflation factors. As shown in Table 2, all factor loadings for CSR indicated strong convergent validity of this construct. The ecological concern and green advertising items showed high internal consistency. The loadings for green buying behavior indicated a good fit. The variance inflation factor values for all items were below the threshold of 3.3, indicating that multicollinearity was not a concern in this study. The R² values indicated that CSR and green advertising explained 31% and 42% of the variance in ecological concern and green buying behavior, respectively.

Table 2. Psychometric Properties of Measures

Construct		Factor loadings (VIF)
CSR	CSR1	.79 (1.88)
	CSR2	.78 (1.90)
	CSR3	.84 (2.18)
	CSR4	.74 (1.60)
	CSR5	.82 (1.95)
ECC	ECC1	.80 (1.67)
	ECC2	.76 (1.73)
	ECC3	.78 (1.69)
	ECC4	.75 (1.27)
GAd	GAd1	.83 (1.97)
	GAd2	.85 (2.21)
	GAd3	.82 (1.82)
	GAd4	.73 (1.46)
GBB	GBB1	.69 (1.28)
	GBB2	.74 (1.31)
	GBB3	.76 (1.78)
	GBB4	.75 (1.72)
R^2	ECC	.31
	GBB	.42

Note. VIF = variance inflation factor; CSR = corporate social responsibility; ECC = ecological concern; GAd = green advertising; GBB = green buying behavior.

The composite reliability values for the constructs indicated high internal consistency, while the average variance extracted values demonstrated good convergent validity (see Table 3). The square root of average variance extracted for each construct was greater than the correlations with other constructs, thus confirming discriminant validity.

Table 3. Validity and Reliability of Constructs

Construct	CR	AVE	M	SD	1	2	3	4
1. Corporate social responsibility	.90	.63	3.20	0.70	.80			
2. Ecological concern	.85	.60	2.80	0.60	.59	.77		
3. Green advertising	.88	.65	3.10	0.65	.65	.59	.81	
4. Green buying behavior	.82	.54	2.70	0.55	.61	.53	.63	.73

Note. CR = composite reliability; AVE = average variance extracted. Square roots of AVE are shown on the diagonal.

The results of the hypothesis testing at a 95% confidence interval are summarized in Table 4. CSR positively predicted ecological concern (Hypothesis 2), and CSR also had a direct positive effect on green buying behavior (Hypothesis 1). Ecological concern positively predicted green buying behavior (Hypothesis 3), and the mediating effect of ecological concern in the relationship between CSR and green buying behavior was significant (Hypothesis 4). Additionally, the moderating effect of green advertising on the relationship between CSR and ecological concern was significant, further strengthening the mediated relationship (Hypothesis 5). Thus, all hypotheses were supported.

Table 4. Hypothesis Testing

Path	Coefficient	95% CI	SD	<i>t</i>	<i>p</i>	Hypothesis
H1. CSR → GBB	0.46	[0.32, 0.58]	0.07	6.85	< .001	Supported
H2. CSR → ECC	0.36	[0.21, 0.50]	0.08	4.64	< .001	Supported
H3. ECC → GBB	0.26	[0.10, 0.38]	0.07	3.49	< .001	Supported
H4. CSR → ECC → GBB	0.09	[0.04, 0.16]	0.03	2.90	.004	Supported
H5. CSR × GAd → ECC	0.11	[0.02, 0.09]	0.03	3.67	.013	Supported

Note. CSR = corporate social responsibility; ECC = ecological concern; GBB = green buying behavior; GAd = green advertising; CI = confidence interval.

These findings provide robust evidence supporting the proposed relationships in the study, exhibiting the impact of CSR communication on social media on green buying behavior, as mediated by ecological concern and moderated by green advertising. We used SMART-PLS to examine the interaction between CSR and ecological concern, as moderated by green advertising (see Figure 1). The simple slope analysis shows the CSR–ecological concern relationship at different levels of green advertising ($M - 1 SD$, M , $M + 1 SD$), illustrating the moderation effect (see Figure 2).

Figure 1. Full Structural Model

Figure 2. Simple Slope Analysis

Note. GAd = green advertising.

Discussion

The results of our study provide crucial supporting evidence for the hypothesized positive effects of social media CSR communication on consumers' ecological concern and green buying behavior. We established that CSR communication was significantly related to ecological concern, which, in turn, had a positive relationship with green buying behavior. These data are also consistent with the results of the previous studies, which indicate that CSR is one of the major ways to enhance consumers' environmental awareness and help them make more sustainable purchasing decisions (Rusyani et al., 2021; Saif et al., 2024). The direct positive effect of CSR on green buying behavior that we found also indicates that transparent and comprehensive CSR communication is crucial to building trust and green purchasing, which supports the results of previous studies investigating the effects of CSR on consumer perceptions and behaviors (Han et al., 2020; Sun et al., 2020).

We identified ecological concern as a significant mediating variable, showing the importance of highlighting ecological concerns in shifting CSR efforts toward green buying. This aligns with the findings of Saif et al. (2024), who argued that environmentally conscious individuals are more likely to engage in sustainable behavior. Effective green advertising further enhances CSR outcomes (Luo et al., 2020); thus, social media can be strategically used by banks in Pakistan for CSR communication and green advertising to improve corporate reputation and promote sustainable consumer behaviors, especially given the severe environmental challenges and high consumer awareness in this country.

Theoretical Implications

Our findings offer new insights into the influence of CSR communication on social media on ecological concern, green advertising, and green buying behavior, which contributes to the existing literature in several ways. While Lii et al. (2013) primarily explored direct associations, our results provide a more comprehensive explanation of how CSR predicts sustainable consumer behavior by identifying the role of the moderating and mediating variables of ecological concern and green advertising. This dual mechanism explains the psychological and external factors that affect green buying behavior, and enriches and extends the TPB by incorporating ecological concern and green advertising as key factors. Additionally, we analyzed the impact of CSR communication on environmental sustainability in Pakistan's banking sector, which is an underexplored area. This is crucial because banks in Pakistan significantly influence consumer behavior and sustainability in a region facing serious environmental challenges. By showing that social media can be a powerful channel for communicating CSR, our study helps to further the theoretical development of CSR and digital engagement in marketing and sustainability.

Practical Implications

Our results have a number of implications for both banking organizations and marketers who wish to improve the sustainability performance of their organization and encourage green consumption. Banks should take advantage of social media platforms to actively advertise their CSR activities (Gupta, Nawaz, Alfalah, et al., 2021) as this not only improves corporate reputation but also increases ecological concern among consumers, thereby encouraging them to make more sustainable purchases. Our study provides evidence of the need to adopt green advertising in CSR communication. To achieve the desirable effect of communicating about their CSR and green initiatives, banks should create advertising campaigns specifically tailored to green advertising and focus on the aspects of their CSR that refer to environmental sustainability. Moreover, to stay competitive, banks should constantly inform and involve their customers in environmental problems through vivid and transparent social media posts. In this way, banks will be able to gain more consumer trust and loyalty and also help to achieve the general goals of sustainable environmental development. These strategies are specifically relevant to banking institutions in developing countries such as Pakistan, as they will help to achieve the essential objective of spreading awareness and promoting sustainable development.

Limitations and Future Research

This study has some limitations. First, the use of a cross-sectional design reduces opportunities to show causality between variables. Longitudinal studies could help to provide a more accurate knowledge of causal linkages. Second, our study focused on the banking sector of Pakistan; thus, the findings may not be applicable to other industries or countries. Further research should be conducted to investigate these relationships in other sectors and locations to improve generalizability. Finally, future researchers could extend the current study by exploring the role of other digital and traditional media channels in the CSR communication process, showing how these affect ecological concern and green buying behavior. Future research that expands on mediating and moderating variables also has the potential to offer valuable insights into sustainable consumer behavior.

Conclusion

The present study showed that CSR communication on social media significantly predicted the green buying behavior of consumers in the banking sector of Pakistan. We found that ecological concern played a mediating role, as established in the literature, and that green advertising moderated the impact of CSR on ecological concern. These results highlight the need to use social networking sites for CSR communication and green advertising as an integral part of corporate communication and reputation management for environmental sustainability. Our findings offer rich theoretical and practical implications by stressing the importance of banking institutions incorporating effective digital communication and interaction channels to achieve sustainability goals and engage consumers in environmentally friendly practices.
