ABSTRACT

With the rapid advancement of artificial intelligence (AI), AI creativity has demonstrated significant potential for application across various fields. This study aims to explore the multidimensional characteristics of AI creativity from the audience's perspective and to develop a corresponding measurement scale. Specifically, Study 1 utilized open-ended interviews with audiences of AI-generated creative products and grounded theory-based data coding to construct a theoretical framework of AI creativity perception. This framework encompasses four core dimensions: originality, depth, credibility, and attractiveness. In Study 2, an exploratory factor analysis and confirmatory factor analysis were conducted to develop a scale with high reliability and validity for measuring AI creativity perception, providing empirical support for the multidimensional framework. To further validate the scale's criterion-related validity, Study 3 examined the effect of AI involvement disclosure on creativity perception. The results reveal that audiences hold biases against AI; although AI is perceived to have a significant advantage in enhancing the originality of creative products, it is viewed as less capable in terms of depth, credibility, and attractiveness. This research offers insights into the future development and iteration of AI creativity.

1 | Introduction

The mastery of creative skills has long been regarded as a symbol of excellence and achievement, providing individuals with a sense of purpose and fulfillment (Tigre Moura 2023). As technology continues to evolve, artificial intelligence (AI) has gained new capabilities—to create (De Vries 2020). Building on this foundation, AI and humans are increasingly collaborating in creative processes, each leveraging unique strengths (Vinchon et al. 2023). This convergence of human and AI creativity has led to novel creative practices. Examples include machine learning-based generative art, deep learning murals, procedurally generated content in video games, and AI-assisted design in fashion and wearable devices (Reddy 2022). A notable case is Coca-Cola's "Real Magic Creative Academy," where generative

AI redefined creativity and advertising standards through innovative AI-driven campaigns (Coca-Cola 2023). In the era of generative AI, advanced AI systems have begun to perform on par with humans in creativity tests (Lazovsky et al. 2024; Orwig et al. 2024), leading to unprecedented transformations in the creative industries.

It is important to note that there are fundamental differences between AI creativity and human creativity in terms of both purpose and process. In terms of purpose, human creativity can be either socially referenced creativity, created for the evaluation and consumption of others, or self-referenced creativity, created to express personal meaning, not necessarily relying on external judgment (Dumas et al. 2024; Dumas and Kaufman 2024). Human creative motivation is complex,

encompassing both the need for social recognition and self-expression (Glăveanu and Beghetto 2021a). In contrast, AI creativity tends to lean more toward socially-referenced creativity, with its creation mainly oriented toward external judgment and societal demands, designed according to others' or societal standards, lacking the self-expressive personal meaning (Marrone et al. 2024). In terms of process, human creativity is typically a highly personalized, emotion-driven process, full of uncertainty and uniqueness (Garcia 2024). The creator's emotions, experiences, and cultural background play significant roles in the creative process, with inspiration often being spontaneous and unpredictable. In contrast, the AI creative process relies more on analyzing and reorganizing vast amounts of data, making it a computation-driven, systematic process (Runco 2025). AI generates creativity by learning patterns and regularities in data, and its creative actions are based more on algorithms and external inputs rather than inner emotions or personal experiences. Given these essential differences, systematically exploring AI creativity has become an important issue in creative management.

However, current research on AI creativity mostly remains at the conceptual level (De Vries 2020; Anantrasirichai and Bull 2022; Vinchon et al. 2023; Baas 2024; Wingström et al. 2024; Marrone et al. 2024), with only a small number of quantitative studies measuring it based on traditional creativity dimensions (Hitsuwari et al. 2023; Tigre Moura et al. 2023; Magni et al. 2024; Lee and Chung 2024). The reason for this gap lies in the lack of an operational definition of AI creativity. Current creativity dimensions and measurement scales primarily focus on the creativity evaluation of traditional products, such as household items (e.g., chairs, cups) (Besemer and O'Quin 1986; Horn and Salvendy 2006), museum products (Cheng et al. 2024), and advertisements (Haberland and Dacin 1992; Ang and Low 2000; Mercanti-Guérin 2008). These scales are designed based on human creative standards, focusing on originality and effectiveness (Runco and Jaeger 2012), but these features do not adequately capture the uniqueness of AI creativity (Runco 2025). Therefore, reassessing the concept of AI creativity while exploring its dimensional characteristics and measurement methods is an urgent priority in contemporary creative research.

This study explores the core dimensions of AI creativity from the audience's perspective and develops a scale. Here, the audience is defined as individuals who engage with, experience, evaluate, and consume creative products generated with the involvement of AI. In the context where traditional creativity research frameworks fail to fully capture the characteristics of AI-generated creativity (Runco 2025), this study attempts to quantify AI creativity through multidimensional analysis. First, semi-structured interviews and grounded theory were used to extract the core dimensions of AI creativity, such as originality, depth, reliability, and attractiveness, laying the foundation for measuring AI creativity. During the scale development and validation process, exploratory and confirmatory factor analyses were conducted to ensure the scale's structural validity and reliability, and item refinement was carried out to enhance the scale's scientific and practical value. Finally, an experimental design tested the impact of AI involvement disclosure on creativity perception, further confirming the scale's applicability and providing a reliable tool for evaluation.

This study contributes in three key ways: First, it enriches existing research on AI creativity perception by proposing a multidimensional theoretical framework for evaluating AI creativity, offering new directions and research tools for academia. Second, it develops an empirically grounded scale that can scientifically and systematically measure the multidimensional attributes of AI creativity, providing reliable data support and practical tools for creative management practices, thus promoting the quantification of AI creativity research. Finally, by analyzing the effect of AI involvement disclosure on creativity perception, this study uncovers audience biases against AI in the creative domain, offering valuable insights for industry and theoretical support for societal acceptance of AI creativity.

2 | Literature Review

2.1 | The Concept of Creativity

Defining "creativity" has long been a challenging and highly debated task (Acar et al. 2017; Green et al. 2024). If researchers are unable to clearly articulate their assumptions about the nature of creativity, the development of creativity theory and the evaluation of related research will encounter significant difficulties (Glăveanu and Beghetto 2021b).

When attempting to understand the concept of creativity, the attributes of creative products, creative abilities, and the creative process are often conflated. This diversity of perspectives stems from the multifaceted meaning of the term "creativity" (Green et al. 2024). On the one hand, it can refer to the characteristics of creative products (Stein 1953; Mumford 2003; Runco and Jaeger 2012; Martin and Wilson 2017; Tigre Moura et al. 2023); on the other hand, it can denote an individual's ability to generate creative products (Guilford 1950; Sternberg and Lubart 1999; Boden 2004; Anantrasirichai and Bull 2022) or the process of generating creativity (Walia 2019; De Garrido 2022; Green et al. 2024). Table 1 outlines the various definitions of creativity. This conceptual ambiguity leads to a lack of clarity in understanding "creativity," resulting in inconsistent conceptual definitions, diverse measurement methods, and increased complexity in theoretical construction within research.

To avoid such contradictions, this study defines AI creativity perception as the audience's perception of the characteristics of creative products generated or assisted by AI.

2.2 | Dimensions and Measurement of Creativity

Creativity, as a multidimensional concept, has been a central focus of academic research. Various scholars have proposed multiple perspectives and tools regarding the dimensions and measurement methods of creativity, which have continuously advanced creativity theory and been widely applied in fields such as advertising, product design, and cultural innovation.

Jackson and Messick (1965) proposed four fundamental dimensions of creativity: unusualness, appropriateness, transformation, and condensation, which provided important references for understanding the characteristics of creative products.

TABLE 1 | Concepts of creativity.

Concept	Definition	References
Product creativity	At a certain time, a novel work is accepted by a group as tenable, useful, or satisfying	Stein (1953)
	Creativity involves the production of novel and useful ideas and products	Mumford (2003)
	Creativity requires both originality and effectiveness	Runco and Jaeger (2012)
	Creativity is often defined as a set of new ideas, which include novel, valuable, impactful ideas that are relevant to the problem they address	Martin and Wilson (2017)
	Creativity is the restructuring and logical reorganization of ideas and structured data to generate novel and valuable solutions	Tigre Moura et al. (2023)
Creative ability	Creativity refers to the ability to generate new and useful ideas	Guilford (1950)
	Creativity is the ability to produce new and useful ideas (i.e., original, ingenious and valuable results (i.e., appropriate and suitable for tasks)	Sternberg and Lubart (1999)
	Creativity is the ability to innovate and produce something valuable and surprising	Boden (2004)
	Creativity is the ability to generate original ideas and think innovatively to produce objects or ideas with new characteristics	Anantrasirichai and Bull (2022)
Creative process	Creativity requires potential originality and effectiveness	Corazza (2016)
	Creativity is a behavior that involves environmental exploration, which leads to effective actions, challenging stereotypes and producing novel, refined, and structured ideas	Walia (2019)
	Creativity is an intellectual process that integrates reflection and imagination, producing objects or ideas with new structures and models, or generating creative frameworks	De Garrido (2022)
	Creativity is a process of generating valuable and original responses to problems	Green et al. (2024)

Building on this foundation, Besemer and Treffinger (1981) developed the creative product analysis matrix (CPAM), which categorized creativity into three dimensions: novelty, resolution, and elaboration and synthesis, further subdividing these into 14 sub-dimensions. CPAM provided a more detailed description of the characteristics of creative products but had not yet formed a specific measurement tool at the time. Subsequently, Besemer and O'Quin (1986) improved CPAM by reducing the number of sub-dimensions and developed the creative product semantic scale (CPSS), which included 70 items, becoming one of the concrete tools for measuring creative products. O'Quin and Besemer (1989) further revised CPSS and introduced a revised version, the R-CPSS, which contained 55 items to enhance the tool's simplicity and practicality. Additionally, Horn and Salvendy (2006) proposed a multidimensional model comprising six sub-dimensions: novelty, resolution, affect, centrality, importance, and desire, and developed the product creativity survey with 21 items. They later streamlined the model to three dimensions—affect, novelty, and importance—reducing the number of items to 14 to facilitate practical application in measurement (Horn and Salvendy 2009).

In the field of advertising creativity, Haberland and Dacin (1992) proposed four dimensions of creativity: originality, appropriateness, condensation, and transformation, and developed an advertising creativity scale with 16 items to systematically

assess the creative characteristics in advertisements. Ang and Low (2000) proposed three dimensions—novelty, meaningfulness, and emotional content—and developed a scale with seven items to evaluate creativity in advertisements using a concise structure. From a consumer perspective, Mercanti-Guérin (2008) proposed three dimensions: novelty, complexity, and esthetics, and developed the perceived advertising creativity scale with 16 items, aimed at capturing consumers' perceptions of creativity in advertisements.

Kharkhurin (2014), from a cross-cultural perspective, proposed four dimensions: novelty, utility, esthetics, and authenticity, forming a cross-cultural creativity model. Kharkhurin's model emphasized the significant impact of cultural background on creativity, understanding, and evaluation. Although no corresponding measurement tool was developed, this theoretical framework provided important reference points for subsequent research. Cheng et al. (2024) proposed five dimensions—affect, usefulness, esthetics, cultural values, and novelty—for the creativity of museum products and developed the museum product creativity model (MPCM), which included 21 items to capture the creative characteristics of cultural products. This model not only expanded the application scenarios of creativity measurement but also reflected the potential of AI in cultural creativity. More classifications of creativity dimensions are presented in Table 2.

TABLE 2 | Dimensions and measurement of creativity.

Concept	Number of dimensions	Dimensions	Scale	References
Creativity	Four dimensions	Unusualness, appropriateness, transformation, condensation	—	Jackson and Messick (1965)
Creative products	Three dimensions, 14 sub-dimensions or 11 sub-dimensions or 9 sub-dimensions	Novelty, resolution, elaboration and synthesis	Creative Product Semantic Scale (CPSS, 70 items or 55 items or 43 items	Besemer and Treffinger (1981); Besemer and O'Quin (1986); O'Quin and Besemer (1989); Besemer (1998); Besemer and O'Quin (1999)
The creativity of an advertisement	Four dimensions	Originality, appropriateness, condensation, transformation	Advertisement Creativity Scale, 16 items	Haberland and Dacin (1992)
Ad Creativity	Three dimensions	Novelty, meaningfulness, emotional content	Advertisement Creativity Scale, 7 items	Ang and Low (2000)
Product creativity	Six sub-dimensions	Novelty, resolution, emotion, centrality, importance, desire	Product Creativity Survey, 21 items	Horn and Salvendy (2006)
Consumers' perception of the creativity of advertisements	Three dimensions	Novelty, complexity, esthetics	Perceived Advertising Creativity Scale, 16 items	Mercanti-Guérin (2008)
Consumer perception of product creativity	Three dimensions	Affect, novelty, importance	Revised-Product Creativity Survey, 14 items	Horn and Salvendy (2009)
Creativity	Two dimensions	Originality, effectiveness	—	Runco and Jaeger (2012)
Western and eastern perspectives on creativity	Four dimensions	Novelty, utility, esthetics, authenticity	—	Kharkhurin (2014)
Artificial intelligence creativity	Four dimensions	Surprise, value, authenticity, intentionality	—	Runco (2025)
Museum product creativity	Five dimensions	Affect, usefulness, esthetics, cultural values, novelty	Museum Product Creativity Measurement, 21 items	Cheng et al. (2024)

Although there is no consensus on the specific components of creativity, it is widely accepted that originality and effectiveness are the two foundational dimensions of creativity (Runco and Jaeger 2012; Kharkhurin 2014). Originality, also referred to as novelty, suggests that if something is not unusual, novel, or unique, it is ordinary, mediocre, or traditional, and therefore not creative. While originality is crucial to creativity, it is not sufficient on its own. To be considered creative, something original must also be effective. Like originality, effectiveness can take various forms, being expressed as (and labeled) usefulness, fit, or appropriateness. These two dimensions constitute the standardized definition of creativity (Runco and Jaeger 2012).

2.3 | AI and Creativity

Generative AI, which uses machine learning (ML) algorithms to semi-autonomously generate new content (Garcia 2024), has proven capable of producing outputs traditionally regarded as creative by society (Zhou and Lee 2024). AI generates novel and valuable creative outputs by systematically extracting and processing both structured and unstructured data (Tigre Moura et al. 2023). It has even begun to perform on par with humans in creativity tests (Lazovsky et al. 2024). Today, AI is increasingly integrated with human creativity and artistic practices, as it demonstrates capabilities such as “seeing,” “hearing,” “speaking,” “moving,” and “writing.” These capabilities allow AI to be applied in various fields, including audio, image, and video analysis, gaming, journalism, script-writing, filmmaking, social media analysis, and marketing (Anantrasirichai and Bull 2022), and it is becoming progressively intertwined with human creativity and artistic practices (Baas 2024). For example, OpenAI has utilized generative AI tools, such as GPT for music creation and StyleGAN for generating realistic images, to help creative professionals innovate their content creation processes (Larsen and Narayan 2023; Amankwah-Amoah et al. 2024).

Despite the widespread recognition of AI's creative capabilities, its limitations in creative generation remain significant. AI struggles to autonomously explore and define creative problems (Vinchon et al. 2023), often requiring collaboration with humans rather than independently generating creative outputs (Rafner et al. 2023; Marrone et al. 2024; Pagani and Wind 2024). AI mimics human behavior through codes, techniques, algorithms, and data to achieve decisions that are similar to or sometimes surpass those of humans (Russell and Norvig 2020). However, creative tasks often require original thinking, rich experience, and an understanding of the audience—elements that AI finds challenging to replicate. The content generated by AI primarily relies on the recombination of existing data and algorithms, rather than independent creative thinking (Marrone et al. 2024). As a result, AI-generated content lacks genuine originality, deep creative thought, and emotional resonance with new ideas (Vinchon et al. 2023). While AI can replicate human creative processes and enhance economies of scale, the generated content may suffer from esthetic and originality deficits, often requiring significant human assistance in defining parameters, overseeing processes, and ensuring quality (Tigre Moura et al. 2023).

AI technology introduces both advantages and disadvantages in the generation of creative products. AI usage significantly enhances the novelty of creative generation, particularly in highly participatory intangible products like music (Tigre Moura et al. 2023). Collaborative works between AI and humans (e.g., AI-generated haiku with human intervention) score higher in esthetic appeal compared to those created solely by AI or humans, suggesting that human–AI collaboration can improve the quality of artistic works (Hitsuwari et al. 2023). Language models generated by AI even outperform humans in divergent thinking tasks (Hubert et al. 2024). Ideas generated with the assistance of ChatGPT receive significantly higher creativity scores than those from traditional web searches or no technological assistance, especially in the case of incremental new ideas, although they perform relatively weakly in disruptive innovation (Lee and Chung 2024). However, AI's application also reduces the collective diversity of new content (Doshi and Hauser 2024).

Moreover, audience attitudes toward AI-generated creativity reflect significant bias. Works labeled as “AI-created” consistently receive lower scores in terms of skill, monetary value, and creativity evaluations compared to those labeled as “human-created,” revealing consumer bias against AI-generated works (Huang et al. 2024). This bias is particularly pronounced in works with strong esthetic appeal and less evident in commercially oriented works (Magni et al. 2024).

Currently, AI creativity faces challenges in evaluation. Most existing studies on AI creativity are qualitative, and the few quantitative studies tend to rely on traditional creativity dimensions, which may not fully capture the distinctions between AI and human creativity. To better understand AI creativity, Runco (2025) proposed four dimensions based on the standard definition of creativity: surprise, value, authenticity, and intentionality. Authenticity refers to the genuineness and accuracy of the content, while intentionality helps explain the motives behind the creative process. The inclusion of these two novel dimensions extends the evaluation of AI creativity beyond novelty and effectiveness, encompassing the authenticity of the content and the motivation behind its creation, thereby constructing a more comprehensive creativity evaluation framework. However, these new dimensions are based on literature review and theoretical inference, lacking empirical support. Therefore, there is an urgent need to explore the dimensions of AI creativity perception from the audience's perspective and to develop appropriate measurement tools.

3 | Study 1: Constructing AI Creativity Dimensions Based on Grounded Theory

Grounded theory is a data collection method that emphasizes the development of theory from data rather than attempting to validate existing theories (Khan 2014). This approach is particularly suitable for exploring the dimensions of constructs, as it allows researchers to extract key dimensions and concepts from real-world data without a predefined framework. In this study, the grounded theory method was applied to explore the dimensions of AI creativity through theoretical sampling, data collection, and data coding.

3.1 | Theoretical Sampling

Theoretical sampling involves purposefully selecting samples based on the needs of theory construction (Glaser 1978). In this study, AI creativity is a new construct proposed from the audience's perspective. Therefore, the study focuses on general audiences who have been exposed to AI-generated content, rather than professionals in the creative field or scholars in creative management. Specifically, these audiences should have some experience with AI-generated content, such as exposure to AI-generated text, images, or videos on social media, online advertising, or other digital platforms. To align with the principles of typicality and consistency in theoretical sampling, participants were required to answer the following questions before the interviews: "Have you been exposed to AI-generated content?" and "Are you familiar with AI-generated content?" Respondents rated their answers on a scale from 1 (strongly disagree) to 7 (strongly agree). Only those who scored higher than 4 on both questions were invited to participate in the formal interviews. This approach was adopted to ensure that participants had a certain level of exposure to and familiarity with AI-generated content, enabling them to effectively reflect on their perceptions of AI creativity.

3.2 | Data Collection

This study used semi-structured in-depth interviews to collect data. The purpose of the interviews was to gather as much information as possible about the characteristics of AI creativity. Semi-structured interviews involve preparing a set of open-ended questions while allowing flexibility to adjust the questions during the interview based on the respondents' answers, facilitating deeper exploration of topics of interest. This method helps to obtain detailed personal perspectives and experiences while maintaining enough structure to ensure that the interview covers the intended topics.

Before conducting the interviews, three scholars in the field of creative management were invited to engage in an in-depth discussion, focusing on the core content and structure of the interview guide to jointly develop a preliminary outline. Following this, four participants with experience in AI-generated content were asked to review the clarity of the interview guide. After revisions, the interview guide included five main questions:

1. What is the most impressive AI-generated content you've encountered (e.g., music, text, image, video)? Please briefly describe it.
2. How do you perceive the creativity of AI-generated content?
3. What specific elements or features of AI-generated content strike you as the most creative?
4. How does the creativity of AI-generated content differ from other content you have encountered in the past?
5. What areas of AI-generated content do you think could be improved in terms of creativity?

After finalizing the interview outline, we conducted one-on-one semi-structured interviews with 44 participants, including 26 males and 18 females. Thirty-eight participants were aged between 21 and 30, and 6 were aged between 31 and 46. According to Hennink and Kaiser (2022), the sample size required to reach data saturation in qualitative research typically ranges from 9 to 17 interviews, particularly when the study population is homogeneous and the research objective is specific. Guest et al. (2006) found that after analyzing 12 interviews, most of the necessary codes for the study had already been generated. Therefore, the sample of 44 participants was sufficient to achieve theoretical saturation. All participants were Chinese, and the interviews were conducted in Chinese. Each interview lasted approximately 30 min. During the interviews, participants were asked to focus on the content characteristics of AI creativity, avoiding discussions about the AI generation process. Appropriate follow-up questions were used to further explore the features of AI creativity.

3.3 | Data Coding

Following the normative coding procedures of grounded theory outlined by Strauss and Corbin (1990), the qualitative data analysis in this study was divided into four stages: open coding, axial coding, selective coding, and the verification of theoretical saturation. The interview data from 36 participants were used for coding, while the data from the remaining 8 participants were used to test theoretical saturation. Two graduate students independently coded the statements related to AI creativity characteristics from the interview transcripts. In the coding process, each participant's interview data were treated holistically, rather than evaluating each question individually. This approach ensured a comprehensive understanding and analysis of the participant's overall responses, avoiding partial interpretations. After coding, inter-coder reliability was assessed through discussion and consistency checks. If disagreements arose, consensus was reached through discussion; if disagreements persisted, a professor of creative management made the final evaluation. The coding results are presented in Appendix A.

3.3.1 | Open Coding

Open coding is the process of conceptualizing and categorizing key phenomena through the analysis and comparison of raw data, encompassing the steps of "labeling → conceptualizing → categorizing." During open coding, we tried to preserve the original wording of the interviewees, coding using their own language and expressions to allow initial concepts to naturally emerge from the data. Following the principle of maximizing possibilities, 391 initial codes were extracted from the interview data based on the combined results of the two coding teams. Then, the two coders independently organized and consolidated the initial codes based on similar or identical meanings. Through comparison and discussion, they ultimately distilled 46 concepts. The categorization process was conducted anonymously by the two coders along with two PhD students in the field of creative management, with multiple rounds of discussion to resolve any inconsistencies until consensus was reached.

The final open coding yielded nine subcategories: freshness, astonishment, content depth, value depth, structural integrity, humanization, accuracy, affective attraction, and experiential attraction.

3.3.2 | Axial Coding

Axial coding involves further organizing the relationships between the subcategories identified in the open coding stage, discovering logical connections between them, and grouping subcategories with similar themes into broader categories. Drawing on existing literature on the dimensions of creativity, the two coders initially worked independently and then discussed and refined their results. Through multiple iterations, consensus was reached, and four main dimensions (core categories) were distilled: originality, depth, credibility, and attractiveness (see Table 3).

3.3.3 | Selective Coding

Selective coding involves further refining and integrating the core categories, identifying the overarching core category that encompasses the majority of the identified subcategories within a broad theoretical framework. Since the primary aim of this study is to explore the construct of AI creativity, “AI Creativity” was chosen as the core category.

3.3.4 | Theoretical Saturation Testing

Theoretical saturation testing serves as the basis for determining whether sampling should be discontinued. Based on the coding results, the remaining 8 reserved samples were recoded following the same procedures described above. The results indicated that no new categories or connections between them emerged, suggesting that the AI creativity dimensions identified in this study had reached theoretical saturation.

4 | Study 2: Development and Validation of the AI Creativity Scale

4.1 | Development of the Initial Measurement Scale

The development of the AI creativity scale followed the process outlined by Churchill Jr. (1979). First, an initial pool of items was generated based on the grounded theory coding results and interview data. Additionally, relevant mature creativity scales were reviewed to supplement and refine the initial item pool, resulting in a total of 44 original items. To ensure content validity, four graduate students were invited to review the readability of the original items, and two experts in the field of creative management reviewed the appropriateness and scientific rigor of the items and questionnaire. After revising, merging, and removing redundant items, a preliminary scale with 37 optimized items was created.

4.2 | Exploratory Factor Analysis

An exploratory factor analysis was conducted to identify the most appropriate items for measuring AI creativity and to preliminarily validate the structural dimensions.

4.2.1 | Sampling and Measurement

The survey was distributed through the “Credamo” platform, and the questionnaire was administered in Chinese in China. Participants were first asked to watch an AI creative micro-video ($N = 300$) titled Shan Hai Xin Jing: “Chang” Goes Home to Visit¹ or an AI creative micro-story ($N = 200$) titled The Penguin and the Polar Bear (see Appendix B). Then, they were asked to complete the AI creativity scale, which was measured using a 7-point Likert scale, with 1 indicating “Strongly Disagree” and 7 indicating “Strongly Agree.” Finally, demographic information was collected from the participants.

TABLE 3 | Coding results.

Main category	Subcategory	Concepts
Originality	Freshness	Unexpected, unprecedented, refreshing, innovation, novel, breaking the norm, unique, original, reorganization, imagination
	Astonishment	Amazing, impact, eye-opening, shock
Depth	Content depth	Profound thoughts, complexity, diversity, richness, comprehensive, emotional resonance
	Value depth	Value, meaning, personalization, usefulness, alignment with theme
Credibility	Structural integrity	Logic, coherence, sense of hierarchy, completeness
	Humanization	Humanoid traits, mechanization, emotional rendering, template-based
	Accuracy	Credibility, realism, detail, clarity, rationality, precision, naturalness
Attractiveness	Affective attraction	Moving, impressive, immersion
	Experiential attraction	Engaging, fun/amusement

The sample size for the exploratory factor analysis was determined based on the recommendation of Comrey and Lee (1992), which suggests that when the sample size is 500, the results of factor analysis are considered excellent. To ensure data quality, we excluded samples that failed the attention check or had a response time below 80 s or above 600 s. Ultimately, we collected 500 valid questionnaires, with a valid response rate of 90.91%. Of these, 32.4% were male; the majority of respondents were aged 21–30 (47.4%) and 31–40 (36.6%); the predominant occupational groups were students (21.0%) and workers/manufacturing professionals (18.2%), with creative professionals from the arts/culture sector (such as painters, sculptors, and art designers) representing 12.2%; and 75.0% had a college or undergraduate degree as their highest level of education.

4.2.2 | Data Analysis

Exploratory factor analysis was conducted using SPSS 24.0. To test the suitability of the data for exploratory factor analysis, Bartlett's test of sphericity was performed, with a χ^2 value of 11941.058, $df=666$, and $p<0.001$, indicating the possibility of shared factors among the items. The Kaiser-Meyer-Olkin (KMO) value was 0.973, suggesting that the data were suitable for factor analysis.

Principal component analysis was then used to extract factors with eigenvalues greater than 1, followed by varimax rotation of the factor solution. Items with factor loadings below 0.4 or cross-loading on two factors were removed (Dastane et al. 2023). Additionally, following the recommendations of Hair et al. (2010) and Dopico-Parada et al. (2021), items with communalities lower than 0.5, indicating low explanatory power, were also considered for removal. Seventeen items, such as “This work gives me a refreshing feeling,” “This work integrates diverse elements or perspectives,” and “This work does not give me a sense of artificial traces or falseness,” were removed.

The final exploratory factor analysis extracted four factors, with item loadings ranging from 0.629 to 0.805. The cumulative variance explained was 67.490%, indicating an ideal factor structure, as shown in Table 4. The results of the exploratory factor analysis suggest that AI creativity is represented by a four-factor structure. Based on the composition of each factor, they were named originality, depth, reliability, and attractiveness. The Omega coefficient for the 20 items derived from the exploratory factor analysis was 0.943, with a 95% confidence interval of [0.931, 0.951], indicating good reliability of the scale (McNeish 2018).

Despite the favorable exploratory factor analysis results, there was potential for item redundancy. To further assess item quality, a 20-item item analysis was conducted. Following Hao's (2021) methodology, three indicators were used for item analysis: corrected item-total correlation (CITC), Omega if item deleted, and discrimination analysis (see Table 5). The results showed that Omega, if any item was deleted, was lower than the overall Omega of 0.943. The item-total correlations were all significant at the 0.001 level, with correlation coefficients ranging

from 0.457 to 0.735, all above 0.40, indicating high internal consistency. In the discrimination analysis, participants' total scores on the AI creativity scale were sorted from high to low, with the top 27% considered the high-score group and the bottom 27% the low-score group. Each item's ability to differentiate between the high-score and low-score groups was tested, with significant differences ($p<0.05$) indicating that the item had good discriminative power and should be retained; otherwise, it should be deleted (Babbie 2004). The results of the discrimination analysis showed that all items reached significance, demonstrating that the items effectively distinguished between high and low scores. Therefore, all items were retained.

4.3 | Confirmatory Factor Analysis

This study conducted a confirmatory factor analysis to further examine the structural validity of the AI creativity scale and its suitability for measurement.

4.3.1 | Sampling and Measurement

The survey was also distributed through the “Credamo” platform. The survey process, data filtering criteria, language, and exploratory factor analysis were consistent with the previous procedure. To validate the external validity of the scale, in addition to the same video ($N=200$) and story ($N=200$) as before, an AI creative music piece ($N=200$) titled *Lonely Boat and Misty Rain*² and a slideshow composed of AI creative images ($N=200$) titled *The Passing Years*³ were also included.

Following Bollen's (1989) recommendation that the sample size for structural equation modeling should be at least 10 times the number of free parameters, a total of 800 valid questionnaires were collected, with a valid response rate of 92.49%. Of these, 43.1% were male; the majority of respondents were aged 21–30 (49.3%) and 31–40 (36.8%); the predominant occupational groups were in IT/internet and students, representing 17.9% and 17.1%, respectively, with creative professionals from the arts/culture sector accounting for 10.0%; and 79.5% had a college or undergraduate degree as their highest level of education.

4.3.2 | Model Fit Testing

This study used the R Shiny application (Dynamic Model Fit, version 2.0.0) developed by Wolf and McNeish (2020) and Mplus 8.3 to perform confirmatory factor analysis. To assess model fit, we calculated the dynamic fit index cutoffs (McNeish and Wolf 2023) and analyzed them in conjunction with traditional fit index cutoffs (Hu and Bentler 1999). The results showed that the χ^2/df was 1.863, well below 3, indicating that the model is parsimonious and fits well. The RMSEA was 0.034, less than 0.06, indicating low error; the CFI, exceeding 0.96, suggests good model fit; and the SRMR was 0.022, further confirming that the model residuals are small and the fit is good. Additionally, based on the evaluation results using dynamic fit decision values, at Level-0, the SRMR met the standard. At Level-2, both the RMSEA and CFI also met the standards. Therefore, the model fits well (see Table 6).

TABLE 4 | Exploratory factor analysis.

Item	Factor loading				Common factor variance
	Factor 1	Factor 2	Factor 3	Factor 4	
O1 The content of this work is unexpected	0.783	0.069	0.143	0.161	0.663
O2 The form of expression in this work is novel	0.646	0.234	0.181	0.234	0.559

O4 This work breaks conventional thinking	0.688	0.213	0.200	0.225	0.609
D1 The ideas in this work are profound and thought-provoking	0.183	0.804	0.201	0.209	0.763
D2 The content of this work is complex and multi-layered	0.166	0.717	0.273	0.172	0.645
D3 This work offers a deep exploration of the theme	0.170	0.805	0.239	0.252	0.798
D4 The meaning expressed in this work is profound	0.167	0.780	0.302	0.232	0.781
D5 This work is useful to individuals or society	0.192	0.717	0.310	0.219	0.696
C1 The content of this work has strong logic	0.129	0.280	0.726	0.139	0.641
C2 The content of this work is coherent	0.117	0.192	0.735	0.298	0.680
C3 The expression in this work feels natural, not mechanical	0.187	0.262	0.680	0.290	0.650
C4 This work appears authentic	0.178	0.254	0.680	0.179	0.590
C5 The expression in this work is clear and straightforward	0.131	0.274	0.750	0.215	0.701
C6 The overall feeling of this work is natural and unforced	0.213	0.170	0.727	0.297	0.692
A1 This work left a strong impression on me	0.278	0.240	0.186	0.738	0.714
A2 This work captured my attention	0.284	0.175	0.270	0.699	0.674
A3 The way this work is presented feels attractive to me	0.235	0.304	0.361	0.629	0.673
A4 I find this work to be attractive	0.135	0.212	0.312	0.748	0.720
A5 This work makes me want to learn more about its content	0.225	0.265	0.275	0.692	0.675
Cumulative explained variance	67.490%				

Note: Factor 1 represents originality, Factor 2 represents depth, Factor 3 represents credibility, and Factor 4 represents attractiveness. The bolded values represent the factor loadings of each item on its corresponding factor.

4.3.3 | Structural Validity Testing

The standardized factor loadings for each item on the corresponding factor all exceeded the minimum threshold of 0.5, and all passed the *t*-test with significance at the $p < 0.001$ level (see Table 7). Additionally, the average variance extracted (AVE) for each factor was greater than 0.5, indicating that the latent variables have good convergent validity.

According to Fornell and Larcker (1981), when the square root of the AVE for a latent variable is greater than the correlation coefficients between that variable and other latent variables, the model is considered to have good discriminant validity. Based on the results in Table 8, the square roots of the AVE for originality, depth, credibility, and attractiveness were 0.797, 0.814, 0.819, and 0.801, respectively, all exceeding the correlation coefficients between the latent variables. This demonstrates that the latent variables in the model have good discriminant validity, effectively distinguishing them from each other. Therefore, dividing AI creativity into the four dimensions of originality, depth, credibility, and attractiveness is reasonable.

4.3.4 | Reliability Analysis

The internal consistency of the scale was assessed using Omega coefficients and Composite Reliability (CR). Omega values measure the consistency among items (McNeish 2018), while CR evaluates the overall reliability performance of each dimension. The results show that both Omega and CR for all dimensions exceeded 0.7 (see Table 7), indicating that the scale has good internal consistency.

5 | Study 3: The Impact of AI Involvement Disclosure on AI Creativity Perception

When humans evaluate creativity, their judgments can be clouded by biases triggered by the characteristics of the creator (Magni et al. 2024). Although AI can generate novel and valuable solutions, the acceptance of these solutions by humans may be influenced by social biases and subjective factors (De Garrido 2022). Thus, it is essential to investigate how the disclosure of AI involvement affects the perception of AI creativity.

5.1 | Hypothesis

Previous research has found that the originality of tangible products (such as artworks and prints) scores higher in cases of full automation or human-AI co-creation, while the novelty of products created solely by humans tends to be rated lower (Tigre Moura et al. 2023). This phenomenon may stem from AI's ability to process extensive data and combine elements in unique ways, breaking through human cognitive limitations and generating novel and distinctive creative outputs. In fully automated or human-AI collaborative scenarios, AI can integrate information from diverse fields to create more novel forms of creativity, whereas such originality is relatively less common in purely human creative processes. Therefore, this study proposes the following hypothesis:

Hypothesis 1a. *The disclosure of AI involvement positively affects the perception of creative product originality.*

Although AI can generate a large volume of creative content, there remains a significant gap between AI and human creativity in terms of depth and innovation. Depth typically requires the creator to rely on personal experience, emotion, and motivation—elements that AI currently struggles to effectively replicate (Vinchon et al. 2023). Human creative

processes often involve exploring new ideas and engaging in deep intellectual reflection, whereas AI's creations are constrained by pre-existing data and algorithms, limiting the depth of its creativity (Garcia 2024). Thus, as the level of AI involvement increases, the perceived depth of the creative product may diminish, leading to a lower perception of its profundity. Based on this reasoning, this study proposes the following hypothesis:

Hypothesis 1b. *The disclosure of AI involvement negatively affects the perception of creative product depth.*

As AI's ability to generate complex artistic works continues to improve, doubts about the credibility of these works have arisen. AI-generated works often lack personal emotional input and unique life experiences from the creator, resulting in lower perceived authenticity (Garcia 2024). Moreover, AI-generated content sometimes exhibits poor logical coherence and a lack of realism (Runco 2025). For example, AI-generated images may frequently contain mistakes, such as incorrect numbers of fingers or distorted details, and even in video generation, issues like stiff facial expressions or unnatural movements may occur. These flaws make it easy for audiences to recognize artificial traces, leading to doubts about the credibility of the works. Therefore, as the level of AI involvement in creative production increases, audiences' perceptions of the credibility of the creative products may be negatively affected. Accordingly, the following hypothesis is proposed:

Hypothesis 1c. *The disclosure of AI involvement negatively affects the perception of creative product credibility.*

Consumers generally feel a greater cultural connection to human creators, which may lead them to prefer products created by humans (Tigre Moura et al. 2023). The emotional expression and cultural background in human creativity can evoke emotional resonance in consumers, while AI-generated works, lacking this emotional and cultural connectivity, tend to be perceived as less attractive. Therefore, as the level of AI involvement increases, the perceived attractiveness of creative products to the audience may decrease (Figure 1). Based on this, the following hypothesis is proposed:

Hypothesis 1d. *The disclosure of AI involvement negatively affects the perception of creative product attractiveness.*

5.2 | Experimental Design

5.2.1 | Experimental Design

The experiment used a static group design, consisting of two groups: a high AI involvement group and a low AI involvement group.

5.2.2 | Manipulation Materials

The AI involvement levels were manipulated using two textual descriptions. The high AI involvement group received the following description: "The entire video creation process was led by AI, responsible for the initial concept, content generation,

and editing. Human creators only reviewed and modified the content in the final stages.” The low AI involvement group was given this description: “The entire video creation process was led by humans, responsible for the main concept, content generation, and editing. AI only provided suggestions and supplemental content at certain stages.”

5.2.3 | Sample

We used G*Power 3.1 software to predict the sample size, setting the parameters for medium effect size ($d = 0.4$), statistical power ($1 - \beta = 0.8$), and significance level ($\alpha = 0.05$). The results indicated that at least 78 participants per group are needed, for a total of 156 participants. The sample for the experiment was part of the confirmatory factor analysis (for the creative micro-video sample), and we collected 200 valid questionnaires, with a valid response rate of 92.17%. Of these, 27.5% were male; the majority of respondents were aged 21–30 (49.5%) and 31–40 (36.5%); the predominant occupational groups were students, service industry, and IT/internet, representing 23.0%, 13.5%, and 13.5%, respectively, with creative professionals from the arts/culture sector accounting for 9.0%; and 79.0% had a college or undergraduate degree as their highest level of education.

5.2.4 | Experimental Procedure

First, participants were randomly assigned to either the high AI involvement group ($N = 100$) or the low AI involvement group ($N = 100$). Next, participants were asked to watch the same creative micro-video as in the previous study and read the manipulation materials. Then, to test the effectiveness of the manipulation, participants answered two questions: “How high was the level of AI involvement in the creation of this micro-video?” and “To what extent did AI contribute to the creative

generation of this micro-video?” Finally, participants were asked to complete the AI creativity scale and provide personal demographic information.

5.3 | Data Analysis

5.3.1 | Manipulation Check

Participants in the high AI involvement group ($M = 6.385$, $SD = 0.585$) perceived AI as playing a significantly larger role in the creative process compared to the low AI involvement group ($M = 3.175$, $SD = 1.250$, $t = -23.256$, $p < 0.001$, Cohen's $d = 3.289$, 95% $CI = [3.018, 3.559]$). Therefore, the manipulation of AI involvement was successful.

5.3.2 | Hypothesis Testing

The results of independent sample t -tests (see Figure 2) showed that for originality, the low AI involvement group ($M = 5.505$, $SD = 0.926$) scored significantly lower than the high AI involvement group ($M = 5.960$, $SD = 0.664$, $t = -3.994$, $p < 0.001$, Cohen's $d = -0.545$, 95% $CI = [0.342, 0.788]$), indicating that the high AI involvement group perceived the creativity as more novel, supporting H1a. For depth, the low AI involvement group ($M = 5.602$, $SD = 0.977$) scored significantly higher than the high AI involvement group ($M = 5.082$, $SD = 0.923$, $t = 3.869$, $p < 0.001$, Cohen's $d = 0.547$, 95% $CI = [0.284, 0.811]$), suggesting that the low AI involvement group perceived the creativity as deeper, supporting H1b. For credibility, the low AI involvement group ($M = 5.575$, $SD = 0.965$) also scored higher than the high AI involvement group ($M = 5.078$, $SD = 1.087$, $t = 3.417$, $p = 0.001$, Cohen's $d = 0.483$, 95% $CI = [0.198, 0.768]$), indicating that the low AI involvement group perceived the creativity as more authentic, supporting H1c. For attractiveness, the low AI involvement group ($M = 6.198$, $SD = 0.576$) scored significantly higher than the high AI involvement group ($M = 5.780$, $SD = 1.018$, $t = 3.575$, $p < 0.001$, Cohen's $d = 0.506$, 95% $CI = [0.276, 0.735]$), showing that the low AI involvement group found the creativity more attractive, supporting H1d.

6 | Discussion

This study defined AI creativity from the audience's perspective, effectively distinguishing it from human creativity. This approach is significant because existing research on AI

FIGURE 2 | The impact of AI involvement disclosure on AI creativity perception. ** $p < 0.01$; *** $p < 0.001$.

creativity often relies on the characteristics of human creativity (e.g., Hitsuwari et al. 2023; Tigre Moura et al. 2023; Magni et al. 2024; Lee and Chung 2024). By utilizing grounded theory, this study constructed a structural model of AI creativity perception and developed a reliable and valid AI creativity perception scale.

As previously discussed, human creativity dimensions have been extensively explored in various fields (Jackson and Messick 1965; Besemer and Treffinger 1981; Haberland and Dacin 1992; Ang and Low 2000; Horn and Salvendy 2006, 2009; Mercanti-Guérin 2008; Kharkhurin 2014; Cheng et al. 2024). However, with AI playing an increasingly prominent role in the creative industry, the theoretical definition and dimensional exploration of AI creativity have become urgent. This study systematically revealed four core dimensions of AI creativity perception from the audience's perspective: originality, depth, credibility, and attractiveness. These dimensions highlight the complexity and diversity of AI creativity, providing a more detailed and scientific perspective for understanding and evaluating AI-generated content. Moreover, the study uncovered audience biases against AI. When audiences learn that AI played a leading role in the creative process, they tend to lower their evaluations of depth, credibility, and attractiveness, but they raise their evaluation of originality. The dimensions are discussed in detail below:

Originality is the primary dimension of AI creativity, aligning with a core principle of human creativity (Runco and Jaeger 2012). However, AI creativity's originality is not simply about being “unexpected” but is instead a multidimensional innovation driven by data (Runco 2025). AI, by processing and integrating vast amounts of data, can generate creative forms and perspectives that differ significantly from traditional human creations. This originality not only manifests as formal breakthroughs but also involves the deconstruction and recombination of existing knowledge systems. AI's ability to detect subtle relationships that humans often overlook and present them in novel ways results in unique creative outputs. However, while this “cold logic” innovation is visually striking and novel, it often lacks the emotional drive and personalized expression typical of human creations, making AI-generated creativity

appear hollow. This reveals a contradiction between originality and creative depth: AI can swiftly capture novel forms and content combinations, but it struggles to imbue its creations with the emotional depth typical of human creativity. This lack of emotional individuality is a major bottleneck in the future development of AI creativity.

Depth is the second key dimension of AI creativity, referring to the characteristic of a creative product that demonstrates profound ideological expression and multi-layered content, enabling deep exploration of themes and evoking deep thought and emotional resonance. Unlike traditional creativity's focus on “meaningfulness” or “effectiveness,” AI-generated works, although structurally sound, often lack the deep emotional and intellectual contributions of human creators. Human creators infuse their work with personal experiences, cultural backgrounds, values, and reflections on real-world issues, creating works that resonate emotionally and offer social commentary (Marrone et al. 2024). These elements form the core of creative depth because they transcend superficial meaning and enter more complex intellectual and emotional realms. However, AI-generated creativity, driven by data analysis and recombination, often lacks the deep intellectual engagement typical of human creators (Garcia 2024). While AI can produce complex thematic structures, it lacks the subjective agency and emotional input of human creators, making it difficult to provoke deep thought in audiences. This lack of depth suggests that AI creativity remains confined to manipulating form and data and has not yet reached the heights of complex humanistic thought (Vinchon et al. 2023), emphasizing the irreplaceability of humans in the dimension of depth.

Credibility is a crucial dimension in shaping audience perceptions of AI creativity. Credibility relates not only to the logical coherence of a work but also to whether it conveys an authentic, heartfelt expression. In the creative domain, credibility is more than formal coherence—it is an ethical commitment in the creative process, where works must stem from the creator's genuine experiences and unique insights (Magni et al. 2024). AI-generated works, relying on existing data, lack independent self-expression and thus struggle to match the credibility of human creations. AI's creative process is essentially algorithm-driven

recombination, and while it can produce logically coherent works, the content often appears mechanical and devoid of emotion. Runco (2025) noted that AI-generated content struggles to carry the “authentic expression” found in human creations because it lacks independent experiences and reflections on the world. AI’s creative limitations lie in its inability to infuse its work with the emotional experiences and personal expression of human creators, causing AI-generated content to be perceived as soulless. Although AI can produce logically sound works, its mechanical expression struggles to elicit emotional resonance in audiences. Improving the credibility of AI creativity and infusing it with more self-expressive characteristics is a major challenge for the future development of AI creativity (Vinchon et al. 2023).

Attractiveness is a key metric of a creative product’s success, emphasizing not only a work’s ability to capture the audience’s attention quickly but also its capacity to sustain interest through deep intellectual and emotional engagement. AI creative products often fall short in attractiveness due to their unbalanced performance across originality, depth, and credibility. While AI-generated works can capture the audience’s attention through originality, their lack of emotional depth and intellectual complexity prevents them from maintaining long-term appeal. Studies show that audiences value creative products that resonate emotionally and intellectually over those that are simply novel (Marrone et al. 2024). Due to AI’s limitations in emotional expression and intellectual depth, audiences may initially be intrigued by AI-generated works but quickly lose interest after deeper engagement. Audiences are more attracted to works that touch their hearts and reflect the creator’s genuine emotions and unique perspectives. This indicates that while AI creations possess some formal attractiveness, they struggle to compete with the emotional and intellectual appeal of human-created works.

In conclusion, this study not only provides a theoretical foundation and practical tools for the multidimensional evaluation of AI creativity perception but also deeply reveals the essential differences and complementarities between AI and human creativity. However, it is important to note that the value perception of creative products is not a static concept; rather, it is a complex and dynamic process that continuously evolves with changes in time, space, and culture (Corazza 2016). This dynamic nature means that the perception of AI creativity cannot be fully captured through a one-time measurement; instead, it must be constantly adjusted and updated in response to the cultural background, social environment, and changes over time of the audience. Therefore, as AI technology continues to advance and creative forms diversify, the perception and evaluation standards of AI creativity will also undergo continuous changes.

7 | Limitations and Future Research Directions

Although this study provides meaningful insights, it has several limitations. First, this study employed grounded theory for manual coding to explore the dimensions of AI creativity—a method that offers flexibility, depth, and theory-generation advantages; however, its subjectivity may lead to information omissions and limit replicability. To address this, future research should consider incorporating objective methods such as automated text

analysis (Herderich et al. 2024) to complement manual coding. Second, although this study expanded the validation process by incorporating a variety of AI-generated creative stimuli—including video, text, music, and image-based formats—the generalizability of these findings could still be limited. All samples were drawn from Chinese participants, and future studies should involve cross-cultural comparisons to examine whether the dimensional structure of AI creativity holds across different cultural or societal contexts. Lastly, the research primarily focused on static creative products while neglecting dynamic creative processes, thereby reducing ecological validity; future studies should investigate AI-human collaboration in real-world environments and examine their interactions and integration in-depth.

Ethics Statement

All procedures conducted in this study involving human participants adhered to the ethical standards set by the institutional research committee and were in compliance with the principles outlined in the 1964 Declaration of Helsinki and its subsequent revisions or equivalent ethical guidelines.

Conflicts of Interest

The authors declare no conflicts of interest.

Appendix A

Coding Results

Raw statement	Initial codes	Core concepts	Subcategory	Main category
1. Many insights provided are indeed things we normally wouldn't think of, or are difficult to conceive under normal circumstances	Many insights, hard to conceive	Unexpected	Freshness	Originality
2. Breaking traditional narrative modes, bringing unexpected plot developments and endings	Unexpected plot developments and endings	Unexpected	Freshness	Originality
3. AI can integrate seemingly unrelated concepts or styles, creating entirely new artistic expressions	Unexpected combinations of elements	Unexpected	Freshness	Originality
4. AI can fuse unrelated themes to create content that is surprisingly unexpected	Creating unexpectedly surprising content	Unexpected	Freshness	Originality
5. Combining seemingly unrelated elements to produce unexpected effects	Creating unexpected effects	Unexpected	Freshness	Originality
6. Capable of providing unexpected perspectives and ideas	Unexpected perspectives	Unexpected	Freshness	Originality
7. Many storylines have unexpected endings	Unexpected endings	Unexpected	Freshness	Originality
8. AI-generated videos present scenes that are hard to anticipate, especially in terms of conception and presentation, showcasing unprecedented creativity	Hard-to-anticipate scenes	Unexpected	Freshness	Originality
9. For example, some video and image concepts are clearly not something we would easily think of; AI always combines various data to deliver unexpectedly surprising effects	Concepts not easily conceived	Unexpected	Freshness	Originality
10. Especially, AI can continuously learn, make new inferences and predictions, enabling it to generate creative content beyond expectations	Creative content beyond expectations	Unexpected	Freshness	Originality
11. AI-generated content is highly innovative, skillfully blending different elements to create surprisingly unexpected effects	Surprisingly unexpected effects	Unexpected	Freshness	Originality
12. AI can attempt unexpected combinations	Unexpected combinations	Unexpected	Freshness	Originality
13. You can never guess what will happen next; AI's plot twists are always unexpected	Unexpected plot twists	Unexpected	Freshness	Originality
14. Especially in story development and plot settings, sometimes it is quite unexpected	Unexpected story development	Unexpected	Freshness	Originality
15. Creating unprecedented combinations and forms	Unprecedented combinations	Unprecedented	Freshness	Originality
16. AI-generated artworks may fuse completely different visual elements to create never-before-seen images	Never-before-seen images	Unprecedented	Freshness	Originality
17. Generating refreshing visual works	Refreshing visual works	Refreshing	Freshness	Originality
18. It can think of angles we might never have considered, sometimes creating content that feels refreshing	Novel angles, refreshing	Refreshing	Freshness	Originality
19. Combining various elements, blending reality and imagination very cleverly, many scenes feel refreshing to me	Element combination, refreshing	Refreshing	Freshness	Originality

Raw statement	Initial codes	Core concepts	Subcategory	Main category
20. Often bringing refreshing effects, especially in the use of colors, presenting unconventional creative styles	Refreshing effects, color creativity	Refreshing	Freshness	Originality
21. In music, AI might mix different genres to create entirely new sounds and rhythms, which are refreshing	New sounds and rhythms, refreshing	Refreshing	Freshness	Originality
22. Beyond ordinary logic, reasonable reasoning, multi-angle thinking examples, and some enlightening content, making it feel very innovative	Super logic, reasonable reasoning, very innovative	Innovation	Freshness	Originality
23. Innovative, capable of generating entirely new content	Innovative content generation	Innovation	Freshness	Originality
24. This innovativeness makes reading AI-generated stories a fun and exciting experience	Innovative experience	Innovation	Freshness	Originality
25. Providing entirely new perspectives and experiences, challenging my understanding of traditional art and media	New perspectives and experiences	Innovation	Freshness	Originality
26. It is these novel elements, unique combinations, and bold innovations that make the content particularly creative	Novel, unique, innovative elements and combinations	Innovation	Freshness	Originality
27. This innovative structural design is relatively rare in traditional works	Innovative structural design	Innovation	Freshness	Originality
28. Making the works more innovative in style and theme	Style and theme innovation	Innovation	Freshness	Originality
29. Breaking through and innovating in unique ways	Breakthrough and innovation	Innovation	Freshness	Originality
30. AI works have innovative ways of expression	Innovative expression	Innovation	Freshness	Originality
31. Generated content is highly innovative in form and expression	Highly innovative	Innovation	Freshness	Originality
32. I think the innovativeness of AI-generated videos and other creations is relatively high	Video creation innovativeness	Innovation	Freshness	Originality
33. Although these images have some creativity, the specific elements and features are not particularly innovative, more of a visualization of existing concepts	Creative visualization	Innovation	Freshness	Originality
34. The elements used by AI are too ordinary, mostly existing things, lacking real innovation	Elements lack innovation	Innovation	Freshness	Originality
35. These innovations add to the appeal and depth of the works	Innovation adds appeal and depth	Innovation	Freshness	Originality
36. Can bring some novel ideas	Novel ideas	Novel	Freshness	Originality
37. Combining scientific concepts with artistic elements to create novel expressions	Novel expressions	Novel	Freshness	Originality
38. AI-generated artworks often blend different styles and elements to create never-before-seen visual effects	Novel visual effects	Novel	Freshness	Originality
39. AI-created works often bring me novel and unique experiences, whether in visuals, audio, or storylines, making me feel refreshed	Novel and unique experiences	Novel	Freshness	Originality

Raw statement	Initial codes	Core concepts	Subcategory	Main category
40. AI composition can blend different music styles to create novel melodies and rhythms, which are surprising	Novel melodies and rhythms	Novel	Freshness	Originality
41. It is these novel elements, unique combinations... that make the content particularly creative	Novel element combinations	Novel	Freshness	Originality
42. Bringing novel reading experiences	Novel reading experiences	Novel	Freshness	Originality
43. Providing audiences with entirely new experiences and perspectives	Novel experiences and perspectives	Novel	Freshness	Originality
44. It might propose some novel concepts, which might be less common	Novel concepts	Novel	Freshness	Originality
45. In art design, the use of color and composition is bold and novel	Novel colors and composition	Novel	Freshness	Originality
46. Satisfying the audience's pursuit of novelty	Satisfying novelty pursuit	Novel	Freshness	Originality
47. Many ideas and presentation methods are indeed quite novel	Novel ideas and presentation	Novel	Freshness	Originality
48. The angles from which AI analyzes problems are mostly based on existing information, summarizing and reasoning, often things humans can already think of, lacking some unconventional, novel perspectives	Lack of novel perspectives	Novel	Freshness	Originality
49. Its novelty is average, more of an integration of existing knowledge rather than entirely new discoveries or breakthroughs	Average novelty	Novel	Freshness	Originality
50. It can not only combine various elements for dynamic generation but also use big data and algorithm analysis to generate content that looks very novel	Generating novel content	Novel	Freshness	Originality
51. AI-generated content is highly innovative, skillfully blending different elements to create surprisingly unexpected effects	Content is highly innovative	Novel	Freshness	Originality
52. If AI-generated content could be more novel, showcasing its own ideas rather than just a collection of material libraries, its creativity would be greatly enhanced	Novelty enhances creativity	Novel	Freshness	Originality
53. Bringing novel reading experiences	Novel reading experiences	Novel	Freshness	Originality
54. The parts I find creative are often its non-traditional combinations in visuals or text	Non-traditional combinations	Breaking the Norm	Freshness	Originality
55. This unpredictable trait sometimes makes it particularly creative	Unpredictable	Breaking the Norm	Freshness	Originality
56. Especially in visual works, creating a sense of "otherness" different from traditional creations through unconventional element combinations	Different from traditional creations	Breaking the Norm	Freshness	Originality
57. AI works boldly break traditional mental stereotypes	Breaking mental stereotypes	Breaking the Norm	Freshness	Originality
58. Breaking conventions and challenging the audience's perceptions	Breaking conventions	Breaking the Norm	Freshness	Originality
59. Combining seemingly unrelated elements... breaking the limits of traditional thinking	Breaking traditional thinking limits	Breaking the Norm	Freshness	Originality

Raw statement	Initial codes	Core concepts	Subcategory	Main category
60. Content that can transcend the ordinary and bring fresh experiences is the embodiment of creativity	Transcending ordinary experiences	Breaking the Norm	Freshness	Originality
61. Able to cross traditional boundaries and break conventional thinking patterns	Crossing traditional boundaries	Breaking the Norm	Freshness	Originality
62. Transcending reality simulations, making AI-generated content appear very unique	Transcending reality simulation	Breaking the Norm	Freshness	Originality
63. Especially AI-generated images or videos, which feel like they completely break traditional creative boundaries	Breaking traditional creative boundaries	Breaking the Norm	Freshness	Originality
64. Every time I see such images, I feel that AI can transcend our traditional esthetic perceptions, bringing a completely new visual experience	Transcending traditional esthetics	Breaking the Norm	Freshness	Originality
65. This sense of freshness is what I find very different from traditional content	Different from tradition	Breaking the Norm	Freshness	Originality
66. AI content sometimes has a more unique structure	Unique structure	Unique	Freshness	Originality
67. Such creativity sometimes lacks personalization and uniqueness	Lack of uniqueness	Unique	Freshness	Originality
68. Generative content is not unique enough	Generated content not unique	Unique	Freshness	Originality
69. In visual arts and music creation, AI might use non-traditional color schemes, compositions, or scales and rhythms to create unique sensory experiences	Unique sensory experiences	Unique	Freshness	Originality
70. It is these novel elements, unique combinations... that make the content particularly creative	Unique element combinations	Unique	Freshness	Originality
71. It might combine natural landscapes with abstract geometric shapes to form unique visual effects	Unique visual effects	Unique	Freshness	Originality
72. AI-generated works can break conventions, bringing unique thoughts and expressions, sparking my interest and thinking	Unique thought expression	Unique	Freshness	Originality
73. AI-drawn images might combine abstraction with realism, presenting a unique esthetic	Unique esthetic	Unique	Freshness	Originality
74. AI-created works often bring me novel and unique experiences, whether in visuals, audio, or storylines, making me feel refreshed	Unique experiences	Unique	Freshness	Originality
75. AI-generated visual content often has a unique esthetic style	Unique esthetic style	Unique	Freshness	Originality
76. AI works present unique perspectives	Unique perspectives	Unique	Freshness	Originality
77. Clever concepts and unique expressions	Unique expressions	Unique	Freshness	Originality
78. Creating unique storylines	Unique storylines	Unique	Freshness	Originality
79. The "depth" makes AI-generated content appear more unique compared to traditional artworks, also showcasing its advantage in creative expression	Unique depth of expression	Unique	Freshness	Originality
80. But it does not show truly innovative ideas or unique artistic expressions	Lack of unique artistic expression	Unique	Freshness	Originality

Raw statement	Initial codes	Core concepts	Subcategory	Main category
81. Videos paired with narration unique to the video, making it one-of-a-kind narration	One-of-a-kind narration	Unique	Freshness	Originality
82. If AI could be more original and generate independent thoughts, it would greatly enhance its performance in the creative field	Enhancing originality	Original	Freshness	Originality
83. AI mostly processes and combines existing data and information, lacking originality or breakthrough ideas, thus performing limitedly in innovation	Lack of original ideas	Original	Freshness	Originality
84. Encouraging more unique creative thinking, avoiding content homogenization, focusing on originality, and providing novel and unique perspectives and experiences	Encouraging originality and uniqueness	Original	Freshness	Originality
85. Enhancing AI's performance in originality and uniqueness, reducing repetition and similarity	Enhancing originality and uniqueness	Original	Freshness	Originality
86. AI can generate a large amount of text in a short time, covering multiple topics or fields, but the depth and originality of its content still need improvement	Originality needs improvement	Original	Freshness	Originality
87. If AI could jump out of existing data frameworks and generate content with independent insights, its creativity would be greatly enhanced	Generating independent insights	Original	Freshness	Originality
88. Hoping that future AI not only imitates or integrates but truly generates new ideas	Generating new ideas	Original	Freshness	Originality
89. Current AI creations, though diverse in form, are mostly recombinations of existing information	Recombination of existing information	Reorganization	Freshness	Originality
90. Although AI can combine different elements to create new content, sometimes it feels like a rearrangement of existing materials	Rearrangement of existing materials	Reorganization	Freshness	Originality
91. Compared to human creations, AI-generated music is more based on copying and combining existing materials and styles	Copying and combining existing materials and styles	Reorganization	Freshness	Originality
92. AI-generated content hardly shows significant creativity compared to human creations, mostly being simple combinations based on existing data, lacking truly unique expressions	Simple combinations based on existing data	Reorganization	Freshness	Originality
93. Providing some novel combinations and structures	Novel combinations and structures	Amazing	Astonishment	Originality
94. It should be the bizarreness that makes me feel it's creative	Bizarre creativity	Amazing	Astonishment	Originality
95. AI-generated videos sometimes seem quite absurd	Absurd effects	Amazing	Astonishment	Originality
96. This content is very curiosity-driven, though there aren't many visual changes in the process, the generated effects are astonishing	Curiosity effects	Amazing	Astonishment	Originality
97. I think AI-generated content isn't particularly creative, it's just its curiosity-driven nature that attracts attention	Curiosity-driven attraction	Amazing	Astonishment	Originality
98. AI-generated video effects are often very stunning	Stunning video effects	Amazing	Astonishment	Originality

Raw statement	Initial codes	Core concepts	Subcategory	Main category
99. AI-generated video effects are quite astonishing, AI can turn static photos into dynamic videos	Astonishing dynamic videos	Amazing	Astonishment	Originality
100. Especially in sci-fi and abstract art styles, often bringing unexpected surprises	Sci-fi abstract surprises	Amazing	Astonishment	Originality
101. AI can use technology to give these characters dynamic expressions and movements, this technology feels truly magical	Magical dynamic technology	Amazing	Astonishment	Originality
102. It feels quite magical	Magical content	Amazing	Astonishment	Originality
103. When I saw it, I thought it was quite magical, AI could generate relatively complete paragraphs with so few prompts	Magical paragraph generation	Amazing	Astonishment	Originality
104. I would consider the content not credible	Content not credible	Credibility	Accuracy	Credibility
105. If AI can focus more on the accuracy and rationality of content while innovating, ensuring that the generated content is based on facts and logic, its creativity will be more trustworthy and have higher application value	Combining innovation and credibility	Credibility	Accuracy	Credibility
106. Lacks organization in the combination of concepts	Lack of organization	Logic	Structural Integrity	Credibility
107. AI-generated content has an advantage in logical structure	Advantage in logical structure	Logic	Structural Integrity	Credibility
108. In complex narratives or designs, AI-generated content may have logical inconsistencies or lack coherence	Logical inconsistency	Logic	Structural Integrity	Credibility
109. Sometimes it doesn't seem logical	Not logical	Logic	Structural Integrity	Credibility
110. It must be logical	Must be logical	Logic	Structural Integrity	Credibility
111. AI-generated content ensures logicity while being innovative	Ensuring logicity	Logic	Structural Integrity	Credibility
112. AI can always arrange content in a very organized manner according to established logic	Organized arrangement	Logic	Structural Integrity	Credibility
113. Often, it combines seemingly conflicting or even impossible elements in a very logical way	Logical combination	Logic	Structural Integrity	Credibility
114. AI-generated content integrates complex information from the internet, and the content... is logical	Content is logical	Logic	Structural Integrity	Credibility
115. Some tools have strong inference and contextual understanding abilities, enabling them to generate content with good logicity and coherence	Logical coherence	Logic	Structural Integrity	Credibility
116. If AI can focus more on the accuracy and rationality of content while innovating, ensuring that the generated content is based on facts and logic, its creativity will be more trustworthy and have higher application value	Accuracy and logic	Logic	Structural Integrity	Credibility

Raw statement	Initial codes	Core concepts	Subcategory	Main category
117. It is no longer just a simple combination of individual elements, but a visual presentation with smooth overall logic that aligns with reality	Smooth overall logic	Logic	Structural Integrity	Credibility
118. If AI can generate longer and more logical videos, it will greatly enhance its application value	Logical videos	Logic	Structural Integrity	Credibility
119. Although lacking originality, AI performs quite well in organizing and structuring information, and the generated text is relatively coherent in logic	Relatively coherent logic	Logic	Structural Integrity	Credibility
120. While maintaining innovation, AI-generated content ensures coherence	Ensuring coherence	Coherence	Structural Integrity	Credibility
121. Often feels quite fluent when reading	Content is fluent	Coherence	Structural Integrity	Credibility
122. Some tools have strong inference and contextual understanding abilities, enabling them to generate content with good logicity and coherence.	Inference and coherence	Coherence	Structural Integrity	Credibility
123. AI is not limited to generating simple backgrounds; it can also intelligently add supplementary elements to the scene, making the overall composition more cohesive and harmonious	Making the overall picture more consistent	Coherence	Structural Integrity	Credibility
124. If AI can make breakthroughs in video duration while maintaining high quality and consistency, its creativity will reach new heights	High quality and coherence	Coherence	Structural Integrity	Credibility
125. AI can refine and optimize lyrics, making the language more fluid and contextually appropriate	Optimizing lyrics for fluency	Coherence	Structural Integrity	Credibility
126. It feels more like a rational person, using a relatively formal writing style to produce content	Resembling a rational person	Humanoid Traits	Humanization	Credibility
127. It is increasingly resembling human writing	Approaching human writing	Humanoid Traits	Humanization	Credibility
128. It lacks the distinctive expressiveness unique to human-generated content	Lacking human uniqueness	Humanoid Traits	Humanization	Credibility
129. The content it produces often lacks human emotions and unique ways of thinking	Lacking human emotion	Humanoid Traits	Humanization	Credibility
130. It needs to understand human emotions and cultural contexts more deeply, integrating more humanized elements	Incorporating humanized elements	Humanoid Traits	Humanization	Credibility
131. Sometimes, it feels lacking in-depth and humanized details	Lacking humanized details	Humanoid Traits	Humanization	Credibility
132. Efforts should be made to minimize the differences between AI-generated and human-generated creativity	Bridging the gap with human creativity	Humanoid Traits	Humanization	Credibility
133. AI-generated content often closely resembles human creations, especially when imitating certain styles or structures	Approaching human creation	Humanoid Traits	Humanization	Credibility
134. This similarity makes it difficult to differentiate from human creations in some contexts	Hard to distinguish from human creation	Humanoid Traits	Humanization	Credibility

Raw statement	Initial codes	Core concepts	Subcategory	Main category
135. Sometimes, AI-generated content may lack human emotions	Lacking human emotion	Humanoid Traits	Humanization	Credibility
136. AI-generated content is similar to human creations in some aspects, such as language expression and logical structure	Similar to human creation	Humanoid Traits	Humanization	Credibility
137. One can often tell it's AI-generated, as it lacks the personalized and nuanced touch unique to human writing	Missing human personalization and nuance	Humanoid Traits	Humanization	Credibility
138. Overall, AI's creativity sometimes feels constrained, unable to shine as freely as humans can, though it's generally acceptable	Limited creative freedom	Humanoid Traits	Humanization	Credibility
139. Although it's AI-generated, the sense of surprise is comparable to human-written stories, sometimes even more creative	Creativity comparable to humans	Humanoid Traits	Humanization	Credibility
140. While the plot can be creative, the expression lacks emotion, often feeling devoid of a "human touch"	Lacking "human touch"	Humanoid Traits	Humanization	Credibility
141. If AI can further improve in humanized expression and customization, its creative performance will be even more outstanding	Improving humanized expression	Humanoid Traits	Humanization	Credibility
142. AI-generated content can mimic human-created styles, structures, and even emotional expressions, making it often indistinguishable from human work	Imitating human creation	Humanoid Traits	Humanization	Credibility
143. Especially in conventional scenarios, the expressiveness of AI-generated videos is not significantly different from human-made works	Minimal difference in expressiveness	Humanoid Traits	Humanization	Credibility
144. Some short video ideas conceived by humans are particularly unique and full of personal style, which AI cannot replicate or replace	Unable to replicate or replace humans	Humanoid Traits	Humanization	Credibility
145. While AI can imitate and generate content, it lacks the creative spark that comes from human inspiration, making it difficult to produce equally novel and unique ideas	Lacking human creative spark	Humanoid Traits	Humanization	Credibility
146. Compared to human creations, AI has clear advantages in content volume and generation speed, but its quality still falls short, especially in-depth and personalization	Quality inferior to human creation	Humanoid Traits	Humanization	Credibility
147. Creativity sometimes feels "mechanized," as it is based on patterns and data recombination rather than unique inspiration or emotional experiences	Mechanized creativity	Mechanization	Humanization	Credibility
148. If AI could better mimic human expression and add more personalized elements, the results might feel more natural and less obviously machine-generated	Easily identifiable as machine-generated	Mechanization	Humanization	Credibility
149. Compared to previous content, AI-generated text sometimes feels linguistically stiff	Stiff language	Mechanization	Humanization	Credibility
150. It looks somewhat mechanized	Mechanized visuals	Mechanization	Humanization	Credibility
151. Although AI can generate content quickly, it often feels a bit mechanized	Mechanized content	Mechanization	Humanization	Credibility

Raw statement	Initial codes	Core concepts	Subcategory	Main category
152. In terms of creativity, AI needs to be more flexible, with more breakthroughs and surprises	Inflexible creativity	Mechanization	Humanization	Credibility
153. Especially in emotional expression, it feels somewhat mechanical	Mechanized emotional expression	Mechanization	Humanization	Credibility
154. Some AI tools show relatively limited creativity, producing content that feels mechanized or lacks depth	Mechanized content generation	Mechanization	Humanization	Credibility
155. It still feels somewhat mechanical	Mechanical feel	Mechanization	Humanization	Credibility
156. Current AI-generated content often appears too monotonous and mechanical, lacking diversity and personalized expression	Monotonous and mechanized	Mechanization	Humanization	Credibility
157. At the same time, it's easy to tell that it's AI-generated	Clearly mechanically generated	Mechanization	Humanization	Credibility
158. AI-generated content often feels like it's crawled, stitched, and synthesized from various websites, lacking originality and independent thought, giving a mechanized impression	Mechanized content generation	Mechanization	Humanization	Credibility
159. Some AI tools show relatively limited creativity, producing content that feels mechanized or lacks depth	Mechanized or lacking depth	Mechanization	Humanization	Credibility
160. It needs to have sufficient depth. Currently, some ideas are still relatively simple, despite their broad perspectives	Requires sufficient depth	Profound thoughts	Content depth	Depth
161. It may have creativity, but it still requires further exploration and development	Needs exploration and development	Profound thoughts	Content depth	Depth
162. The content needs to deepen in meaning, expressing profound and thoughtful ideas, not just being interesting or novel	Enhancing content depth	Profound thoughts	Content depth	Depth
163. I hope the creativity is not just based on rule combinations but more like works with deep thinking	Deep thinking	Profound thoughts	Content depth	Depth
164. Delve deeper into themes, providing thoughtful insights rather than just surface-level novelty	Exploring theme depth	Profound thoughts	Content depth	Depth
165. It should provoke deeper reflection and resonance	Provoking deep reflection	Profound thoughts	Content depth	Depth
166. This intelligent reasoning ability makes AI-generated content appear more profound and realistic in its creative expression	Profound and realistic	Profound thoughts	Content depth	Depth
167. Especially with some content, it feels as though it has been carefully considered. Even though it's machine-generated, the reading experience can be quite good at times	Thoughtful content	Profound thoughts	Content depth	Depth
168. Particularly in sci-fi-style images, AI can express a vision of the future or reflections on reality through clever composition and color coordination	Vision or reflection on reality	Profound thoughts	Content depth	Depth
169. However, it still falls short in fully showcasing the details and depth of textual descriptions	Lacking detail and depth	Profound thoughts	Content depth	Depth

Raw statement	Initial codes	Core concepts	Subcategory	Main category
170. In literature, storylines are no longer limited to linear narratives but adopt non-linear, flashback, or multi-perspective techniques, adding depth to the reading experience	Increasing reading depth	Profound thoughts	Content depth	Depth
171. Some textual and visual content lacks depth	Lacking depth in text and visuals	Profound thoughts	Content depth	Depth
172. In stories and literary works, AI-generated characters sometimes lack three-dimensionality and development	Lacking three-dimensionality	Profound thoughts	Content depth	Depth
173. Compared to other content I've seen in the past, AI-generated images are indeed more profound	More profound content	Profound thoughts	Content depth	Depth
174. Sometimes, it feels lacking in-depth and humanized details	Lacking depth and detail	Profound Thoughts	Content depth	Depth
175. Sometimes, AI-generated content may lack depth	Content lacks depth	Profound thoughts	Content depth	Depth
176. Although it can handle the breadth of information, it feels slightly lacking in-depth	Insufficient depth	Profound thoughts	content Depth	Depth
177. AI can quickly generate large volumes of text, but this content often lacks depth and personalization	Content lacks depth	Profound thoughts	Content depth	Depth
178. AI can generate large amounts of text in a short time, covering multiple topics or fields, but the depth and originality of the content still need improvement	Content depth and originality need improvement	Profound thoughts	Content depth	Depth
179. Sometimes, it adds extra details beyond expectations, making the visuals more layered	Adding extra details for layering	Sense of hierarchy	Structural integrity	Credibility
180. I think AI-generated content could be further refined, especially in handling different situations with more layers and distinctions	Refining content for layering	Sense of hierarchy	Structural integrity	Credibility
181. Additionally, in terms of creativity, it would be better if it could hierarchically process different scenes	Hierarchical processing for layering	Sense of hierarchy	Structural integrity	Credibility
182. Emotional aspects also need to be deepened	Deepening emotions	Emotional rendering	Humanization	Credibility
183. It is somewhat lacking in emotional depth and personalized expression	Lacking emotional depth	Emotional rendering	Humanization	Credibility
184. AI-generated works can also convey a certain emotional atmosphere	Conveying emotional atmosphere	Emotional rendering	Humanization	Credibility
185. AI-generated works may appear somewhat flat or superficial in emotional expression	Flat emotional expression	Emotional rendering	Humanization	Credibility
186. AI can further improve in emotional depth, making the content more impactful and resonant	Enhancing emotional depth	Emotional rendering	Humanization	Credibility
187. I hope it can create more emotionally rich content	Creating emotionally rich content	Emotional rendering	Humanization	Credibility
188. There's a lack of subtle emotional expression	Lacking subtle emotions	Emotional rendering	Humanization	Credibility
189. It lacks the inspiration and emotion found in human creations	Missing emotional inspiration	Emotional rendering	Humanization	Credibility

Raw statement	Initial codes	Core concepts	Subcategory	Main category
190. AI-generated content still falls short in emotional expression	Insufficient emotion	Emotional rendering	Humanization	Credibility
191. I think AI can still improve in emotional expression	Emotional aspects need improvement	Emotional rendering	Humanization	Credibility
192. AI-generated content is somewhat lacking in emotional and humanistic care. Its expression is more based on rationality and data, missing the warmth of an emotional perspective and the care and understanding between people	Lacking emotional and humanistic touch	Emotional rendering	Humanization	Credibility
193. Each image has a unique atmosphere. Whether through color use or light and shadow treatment, it precisely conveys a specific emotion	Precise emotional conveyance	Emotional rendering	Humanization	Credibility
194. It doesn't just present visual effects; often, AI-generated images convey metaphors or emotions, making one feel there's deeper meaning behind them	Conveying metaphors or emotions	Emotional rendering	Humanization	Credibility
195. Perhaps because it's machine-generated, the overall feeling is colder, with less emotional flow	Lacking emotional flow	Emotional rendering	Humanization	Credibility
196. Providing more enriching and valuable experiences	Enriching valuable experiences	Value	Value depth	Depth
197. If AI can focus more on the accuracy and rationality of content while innovating, ensuring that its generated content is both creative and factually/logically sound, its creativity will become more trustworthy and have higher application value	Enhancing application value	Value	Value depth	Depth
198. If AI can generate longer and more logical videos, it will significantly enhance its application value	Logical videos enhance application value	Value	Value depth	Depth
199. If AI can further enhance its data-driven creative capabilities, its creativity will become more practical and innovative	Strengthening data-driven creativity for practical value	Value	Value depth	Depth
200. Delivering a strong visual impact	Strong visual impact	Impact	Astonishment	Originality
201. Although these videos are virtual, the emotional impact they bring is real	Genuine emotional impact	Impact	Astonishment	Originality
202. Especially with AI-generated images or videos, it feels like traditional creative boundaries are completely broken, delivering a powerful visual impact	Powerful visual impact	Impact	Astonishment	Originality
203. Particularly when animating characters, it feels as though the people in the photos have "come to life," creating a visually striking effect	Visually striking	Impact	Astonishment	Originality
204. AI can quickly generate highly impactful images	Quickly generating impactful images	Impact	Astonishment	Originality
205. It can use technical means to present visuals that are hard to imagine, creating a strong sense of impact	Highly impactful visuals	Impact	Astonishment	Originality
206. By imitating and processing, AI exaggerates and humorizes originally serious content, generating entertaining videos that deliver a strong sense of contrast and visual impact	Entertainment and visual impact	Impact	Astonishment	Originality

Raw statement	Initial codes	Core concepts	Subcategory	Main category
207. AI-generated images excel in visual impact	Outstanding visual impact	Impact	Astonishment	Originality
208. These reversals or unexpected designs are quite interesting, often catching the eye	Interesting reversal design, eye-catching	Eye-opening	Astonishment	Originality
209. It can combine various elements to create many novel things, catching the eye	Combining elements for novelty, eye-catching	Eye-opening	Astonishment	Originality
210. I think AI-generated content has quite novel themes, often giving me a sense of surprise	Novel themes bring surprise, eye-catching	Eye-opening	Astonishment	Originality
211. These reversals or unexpected designs are quite interesting, often catching the eye	Reversal design, eye-catching	Eye-opening	Astonishment	Originality
212. Combining familiar elements with novel designs creates a particularly awe-inspiring feeling	Familiar elements with novel designs, awe-inspiring	Shock	Astonishment	Originality
213. AI-generated images often combine impossible elements, presenting them through visual art, which feels particularly awe-inspiring	Artistic presentation, awe-inspiring	Shock	Astonishment	Originality
214. The overall visual experience is awe-inspiring. Compared to traditional creation, this generative approach is more eye-catching	Awe-inspiring visual experience	Shock	Astonishment	Originality
215. Compared to the past, it can now express more complex content	Complex content	Complexity	Content depth	Depth
216. In literary creation, AI might adopt non-linear or multidimensional narrative approaches	Non-linear or multidimensional narratives	Complexity	Content depth	Depth
217. I think AI can combine complex content to generate images or videos	Generating complex content combinations	Complexity	Content depth	Depth
218. I hope AI can provide more dimensions and nuanced ways of expressing emotions or presenting complex concepts	Emotional expression and complex concept presentation	Complexity	Content depth	Depth
219. It can write very complex stories or articles	Complex story and article creation	Complexity	Content depth	Depth
220. AI can further develop in artistic expression to create more complex styles	Artistic expression of complex styles	Complexity	Content depth	Depth
221. Current works exhibit higher diversity and openness in creativity	Creative diversity	Diversity	Content depth	Depth
222. It can present a large volume of content with different styles and themes in a short time, offering more choices and possibilities	Content with different styles and themes	Diversity	Content depth	Depth
223. AI can easily connect knowledge from different fields, often generating content with interdisciplinary perspectives	Interdisciplinary perspectives	Diversity	Content depth	Depth
224. It can showcase a diversity of styles	Diverse style presentation	Diversity	Content depth	Depth
225. Whether generating images or videos, AI can present multiple styles under the same theme	Multiple styles under one theme	Diversity	Content depth	Depth
226. This diversity of styles is a major advantage of AI-generated content over traditional creation	Advantage of diverse styles	Diversity	Content depth	Depth
227. AI needs to further improve the diversity of its generated content	Enhancing content diversity	Diversity	Content depth	Depth

Raw statement	Initial codes	Core concepts	Subcategory	Main category
228. It can integrate video, text, images, and other formats	Multi-format integration	Diversity	Content depth	Depth
229. AI-generated artworks often fuse different styles and elements	Fusion of different styles and elements	Diversity	Content depth	Depth
230. AI can also incorporate different artistic styles, combining retro, futuristic, abstract, and other elements to create a visual effect that feels both unfamiliar and familiar	Integration of multiple artistic styles	Diversity	Content depth	Depth
231. AI can also achieve rich content with a high density of information	Rich content and high information density	Richness	Content depth	Depth
232. AI-generated content has an advantage in terms of information richness	Advantage in information richness	Richness	Content depth	Depth
233. It gives the impression of being diverse and colorful, offering a refreshing experience with different perspectives on the same subject	Diverse and colorful content	Richness	Content depth	Depth
234. I hope to see more richly developed characters	Enriching character expectations	Richness	Content depth	Depth
235. The content of the articles is quite rich, covering a broad range of topics	Wide and rich article content	Richness	Content depth	Depth
236. It feels like there's a lot of information	High information density	Richness	Content depth	Depth
237. AI considers various possible angles, making the content information-rich and broadly covered	Broad information coverage	Richness	Content depth	Depth
238. It doesn't feel monotonous	Avoiding monotony	Richness	Content depth	Depth
239. It can start from many details, transforming ordinary elements into creative sci-fi visuals through unique combinations and designs	Detailed creativity in Sci-Fi imagery	Richness	Content depth	Depth
240. It can use image expansion to fill in more details, enriching simplified visuals, showcasing AI's creativity in image creation	Expanding details with image expansion	Richness	Content depth	Depth
241. I think the most creative aspect is how it fuses many cross-border elements together	Cross-border element fusion	Richness	Content depth	Depth
242. The content is more comprehensive, providing answers from a problem-solving perspective	Comprehensive content	Comprehensive	Content depth	Depth
243. AI-generated content integrates complex information from the internet, making it more comprehensive	Comprehensive information integration	Comprehensive	Content depth	Depth
244. What I find creative about AI-generated content is its ability to integrate and summarize various answers from the web	Comprehensive creative content integration	Comprehensive	Content depth	Depth
245. AI can quickly aggregate information to provide relatively comprehensive answers	Providing comprehensive answers through information aggregation	Comprehensive	Content depth	Depth
246. AI-generated content indeed appears more comprehensive	Comprehensive content generation	Comprehensive	Content depth	Depth
247. It can combine vast amounts of information in a short time to form relatively complete content	Combining information into complete content	Comprehensive	Content depth	Depth

Raw statement	Initial codes	Core concepts	Subcategory	Main category
248. AI-generated content is more systematic and comprehensive	Systematic and comprehensive content presentation	Comprehensive	Content depth	Depth
249. It can integrate a lot of relevant information, offering a more holistic perspective on issues	Integrating relevant information	Comprehensive	Content depth	Depth
250. It makes you truly feel that the video is a result of a major production effort, giving it a sense of significance	Meaningful videos	Meaning	Value depth	Depth
251. Breaking traditional narrative structures... enhances the appeal of the work	Breaking traditional narrative structures for appeal	Engaging	Experiential attraction	Attractiveness
252. AI-designed animation clips may use unprecedented color combinations and graphic designs, making them captivating	Color and graphic design, captivating	Engaging	Experiential attraction	Attractiveness
253. Especially in handling complex dynamics and ecological environments, the detailed performance makes AI-generated videos more attention-grabbing	Detailed performance draws attention	Engaging	Experiential attraction	Attractiveness
254. They have clear motives, personalities, and growth trajectories, making the story more engaging	Clear motives and personalities make it engaging	Engaging	Experiential attraction	Attractiveness
255. While generating images and videos, it can attract me	Attractiveness of generated content	Engaging	Experiential attraction	Attractiveness
256. Sometimes, AI-generated content can be eerie, deeply captivating me	Allure of eerie content	Engaging	Experiential attraction	Attractiveness
257. AI-generated visual content... can capture the audience's visual attention	Visual content attracts attention	Engaging	Experiential attraction	Attractiveness
258. It's this atmosphere and diverse artistic styles that make AI-generated images particularly creative and attractive	Atmosphere and diverse artistic styles are attractive	Engaging	Experiential attraction	Attractiveness
259. Especially complex scenes or efficient animation production can quickly catch the eye	Attraction of complex scenes and efficient animation	Engaging	Experiential attraction	Attractiveness
260. AI-generated content still touches on universal human themes like love, nature, and technology, resonating with the audience	Universal themes evoke resonance	Emotional resonance	Content depth	Depth
261. AI can deeply understand and convey complex human emotions, making the work touching and evoking deeper resonance	Deep understanding and conveyance of human emotions, evoking resonance	Emotional resonance	Content depth	Depth
262. AI-generated content can provoke my thoughts and emotional resonance	Provoking thought and emotional resonance	Emotional resonance	Content depth	Depth
263. It focuses on building emotional connections with the audience, conveying profound thoughts or emotions	Building emotional connections with the audience	Emotional resonance	Content depth	Depth
264. The content can focus more on complex human emotions and psychology, presenting them in a nuanced way to enhance audience resonance	Focusing on complex emotions and psychology, enhancing resonance	Emotional resonance	Content depth	Depth
265. Especially when seeing departed individuals "reappear" in this way, the emotions are quite complex, feeling both magical and touching	Emotional reappearance of departed figures	Emotional resonance	Content depth	Depth
266. It lacks the kind of empathetic emotional expression that resonates deeply	Lacking empathetic emotional expression	Emotional resonance	Content depth	Depth

Raw statement	Initial codes	Core concepts	Subcategory	Main category
267. Its content often feels too rational and calm, lacking emotional connection with the audience	Content rationality and lack of emotional connection	Emotional resonance	Content depth	Depth
268. It feels as though frozen moments in time are reanimated, and this creativity is truly touching	Reanimating life, touching	Moving	Affective attraction	Attractiveness
269. Compared to human-created content, AI-generated works appear complete but lack the power to touch hearts	Lacking the power to touch hearts	Moving	Affective attraction	Attractiveness
270. If more emotional expression and personalized elements are added, AI's creativity will significantly improve, better attracting and touching hearts	Enhancing emotional expression and personalization to touch hearts	Moving	Affective attraction	Attractiveness
271. AI-generated content sometimes overlooks cultural context and details, resulting in a lack of realism	Lacking realism due to ignored cultural context and details	Realism	Accuracy	Credibility
272. But it often feels unrealistic	Often feels unrealistic	Realism	Accuracy	Credibility
273. It needs to have realism	Need for realism	Realism	Accuracy	Credibility
274. I hope to see more realistic characters	Desire for more realistic characters	Realism	Accuracy	Credibility
275. Although AI is highly creative, I think there's still room for improvement in terms of realism	Room for improvement in realism	Realism	Accuracy	Credibility
276. Especially in details related to real-world objects, AI's processing is not yet sufficient, sometimes making it feel unrealistic	Inadequate handling of real-world object details	Realism	Accuracy	Credibility
277. If these details could be made closer to reality and add a more realistic touch, I think the results would be more outstanding and immersive	Closer to reality and adding realistic touch	Realism	Accuracy	Credibility
278. Sometimes, the generated content can be distorted, especially in certain details, which may not meet expectations	Content distortion and detail mismatch	Realism	Accuracy	Credibility
279. It could consider integrating regional customs and habits to generate content that better fits real-world scenarios	Combining regional customs for realistic content	Realism	Accuracy	Credibility
280. Additionally, in terms of creativity, if AI could hierarchically process different scenes to generate more realistic content, that would be even better	Hierarchical scene processing for realistic content	Realism	Accuracy	Credibility
281. However, if there's room for improvement, I think the realism of AI-generated content still needs enhancement	Realism needs improvement	Realism	Accuracy	Credibility
282. AI can automatically process a large number of details, making originally distorted images appear more realistic and natural, a capability unmatched by traditional techniques	Automatic detail processing enhances realism and naturalness	Realism	Accuracy	Credibility
283. In these videos, the ecology and movements of characters are very lifelike, almost resembling real-world scenes	Lifelike character ecology and movements	Realism	Accuracy	Credibility
284. Whether it's the changes in character expressions or the fluidity of movements, it feels as though these characters truly exist in our world	Character expressions and movement fluidity enhance realism	Realism	Accuracy	Credibility

Raw statement	Initial codes	Core concepts	Subcategory	Main category
285. This ability allows AI to create realistic environments in videos that align with the theme	Creating realistic environments that fit the theme	Realism	Accuracy	Credibility
286. This makes AI-generated visuals more realistic	Realistic visuals	Realism	Accuracy	Credibility
287. However, sometimes the content feels overly exaggerated or “out-of-place,” making AI’s creativity seem somewhat detached from reality and slightly exaggerated	Exaggerated content and “Out-of-Place” feel	Realism	Accuracy	Credibility
288. Such creativity sometimes lacks personalization and uniqueness	Lacking personalization and uniqueness in creativity	Personalization	Value depth	Depth
289. Current works tend to be more personalized and differentiated, daring to try new forms and themes	Trend toward personalization and differentiation	Personalization	Value depth	Depth
290. By providing content tailored to different viewers’ preferences and needs, it enhances user engagement and satisfaction	Tailored content enhances engagement and satisfaction	Personalization	Value depth	Depth
291. I think AI still has room for improvement in personalization	Room for improvement in personalization	Personalization	Value depth	Depth
292. Although the generated content appears complete, it often feels like it’s missing something personalized	Generated content lacks personalization	Personalization	Value Depth	Depth
293. If AI could further improve in personalized customization, its creative performance would be even more outstanding	Need for improvement in personalized customization	Personalization	Value depth	Depth
294. Although it can generate high-quality patterns, there’s still room for improvement in understanding and translating user-specific needs, especially in precision and personalization	Improvement needed in understanding user needs and personalization	Personalization	Value depth	Depth
295. AI can quickly generate large volumes of text, but this content often lacks depth and personalization	Mass-generated content lacks depth and personalization	Personalization	Value depth	Depth
296. Compared to human creation, AI has clear advantages in content volume and generation speed, but its quality still falls short, especially in-depth and personalization	Advantage in content volume and speed but lacking personalization	Personalization	Value depth	Depth
297. I hope future AI-generated content can be more personalized	Demand for personalization	Personalization	Value depth	Depth
298. It can leave a deep impression through diverse patterns and color combinations	Diverse patterns and color combinations leave a deep impression	Impressive	Affective attraction	Attractiveness
299. The effects are truly memorable	Memorable effects	Impressive	Affective attraction	Attractiveness
300. I always feel that AI’s performance is truly memorable	AI’s performance leaves a deep impression	Impressive	Affective attraction	Attractiveness
301. This visual impact makes AI-generated videos particularly memorable for me	Visual impact creates memorable moments	Impressive	Affective attraction	Attractiveness
302. Although not particularly creative, the quick response and generation capability have left a deep impression on me	Quick response and generation capability leave a deep impression	Impressive	Affective attraction	Attractiveness
303. This capability is especially useful in data analysis and reporting scenarios, leaving a very deep impression on me	Deep impression in data analysis and reporting scenarios	Impressive	Affective attraction	Attractiveness

Raw statement	Initial codes	Core concepts	Subcategory	Main category
304. The ability to simulate specific styles and artists has left a deep impression on me	Deep impression in simulating specific styles and artists	Impressive	Affective attraction	Attractiveness
305. AI-generated content can still improve in uniqueness and nuance	Room for improvement in uniqueness and nuance	Detail	Accuracy	Credibility
306. Many details are handled quite well	Detail handling is well-done	Detail	Accuracy	Credibility
307. AI-generated content indeed appears more comprehensive, with many details	Comprehensive content with many details	Detail	Accuracy	Credibility
308. Although AI responses are quick, they sometimes feel a bit generic, lacking specific analysis	Lacking specific analysis in responses	Detail	Accuracy	Credibility
309. It can showcase a lot of detail handling	Showcasing detail handling	Detail	Accuracy	Credibility
310. And the details are handled with great nuance	Nuanced detail handling	Detail	Accuracy	Credibility
311. Especially in handling complex dynamics and ecological environments, the performance is nuanced	Nuanced performance in complex dynamics and ecological environments	Detail	Accuracy	Credibility
312. However, it still falls short in fully showcasing the details and depth of textual descriptions	Lacking detail and depth in text descriptions	Detail	Accuracy	Credibility
313. Sometimes, the generated patterns cannot fully convey the meaning of the source text, still needing improvement in precision and detail	Pattern detail communication needs improvement	Detail	Accuracy	Credibility
314. AI-generated content is more precise and detailed compared to traditional methods	More precise and detailed content generation	Detail	Accuracy	Credibility
315. Although it can generate large volumes of content, it lacks a fine-tuned feel, resulting in weaker overall creative performance	Lacking fine-tuning feel	Detail	Accuracy	Credibility
316. Currently, AI-generated images have good visual effects, but the detail handling still feels somewhat stiff	Stiff detail handling	Detail	Accuracy	Credibility
317. AI can restore originally blurry or low-quality images and videos using advanced technology, making them clearer. It can even animate static portraits, giving them a sense of vitality	Enhancing image and video clarity	Clarity	Accuracy	Credibility
318. Integrate information from various sources and present it in concise and clear language	Information integration and clear expression	Clarity	Accuracy	Credibility
319. The text generated by AI is often unclear, frequently resembling a monotonous narrative	Unclear text expression	Clarity	Accuracy	Credibility
320. The texture of the images is excellent, with high resolution, and the color saturation is pleasing	Image texture and color clarity	Clarity	Accuracy	Credibility
321. Through simple descriptions, AI can quickly transform them into visual elements, providing users with intuitive images. This generation process is highly convenient and efficient	Simple and clear image generation process	Clarity	Accuracy	Credibility

Raw statement	Initial codes	Core concepts	Subcategory	Main category
322. Moreover, the charts it generates often have a clear structure, making the information easy to understand and helping us quickly grasp complex data	Clear chart structure and information	Clarity	Accuracy	Credibility
323. In such cases, the generated content may appear novel but carries potential risks in terms of scientific validity	Novel content with potential scientific flaws	Rationality	Accuracy	Credibility
324. If AI can focus more on the accuracy and reasonableness of content while innovating, ensuring that the generated content is both creative and factually/ logically sound, its creativity will become more trustworthy and valuable	Balancing innovation with accuracy and reasonableness	Rationality	Accuracy	Credibility
325. Although AI can generate content based on instructions, the results often deviate from expectations during repeated modifications and adjustments, becoming highly unreasonable	Generated content deviates from expectations and lacks reasonableness	Rationality	Accuracy	Credibility
326. The reasonable combinations and arrangements make me feel that AI demonstrates a certain level of creativity in understanding overall layouts and scene designs	Scientific and reasonable combinations with creativity	Rationality	Accuracy	Credibility
327. I believe there is still room for improvement in the creativity of AI-generated content, especially in terms of scientific accuracy. While AI can produce innovative and forward-thinking content, it sometimes makes common-sense errors, particularly when dealing with complex scientific knowledge	Room for improvement in scientific reasonableness	Rationality	Accuracy	Credibility
328. AI still has room for improvement in creativity, especially in terms of precision	Room for improvement in creative precision	Precision	Accuracy	Credibility
329. I think if AI could better understand specific user needs, its creative output would be more effective	Enhancing precision in user needs for better creativity	Precision	Accuracy	Credibility
330. Just by inputting a few sentences, it can provide relatively accurate responses, which I find impressive	Accurate response capability	Precision	Accuracy	Credibility
331. Although AI can combine numerous elements and styles when generating images, sometimes we hope to see more precise and data-driven results	Precision and data-driven results	Precision	Accuracy	Credibility
332. AI can use complex algorithms to restore blurry or distorted photos with high precision, achieving results almost indistinguishable to the naked eye	High-precision restoration technology	Precision	Accuracy	Credibility
333. Compared to other content I've seen, AI demonstrates higher precision in image restoration and video synthesis	High precision in image restoration and video synthesis	Precision	Accuracy	Credibility
334. Although AI-generated content is already very advanced, its output sometimes lacks precise alignment with specific requirements	Lack of precision in addressing specific needs	Precision	Accuracy	Credibility

Raw statement	Initial codes	Core concepts	Subcategory	Main category
335. I believe there is still room for improvement in the creativity of AI-generated content, especially in terms of scientific accuracy. While AI can produce innovative and forward-thinking content, it sometimes makes common-sense errors, particularly when dealing with complex scientific knowledge	Room for improvement in scientific and accurate creativity	Precision	Accuracy	Credibility
336. AI-generated content is becoming increasingly refined, with traces of stitching becoming less noticeable, requiring careful scrutiny to detect	Precision in image restoration details	Precision	Accuracy	Credibility
337. Sometimes, the generated patterns cannot fully convey the meaning of the source text, and improvements in precision and detail are still needed	Need for precision in pattern details	Precision	Accuracy	Credibility
338. AI-generated content is more precise and detailed compared to traditional methods	More precise and detailed content generation	Precision	Accuracy	Credibility
339. Although it can generate high-quality patterns, there is still room for improvement in understanding and translating specific user needs, especially in terms of precision and personalized application	Room for improvement in understanding and personalization precision	Precision	Accuracy	Credibility
340. Whether generating text or images, AI can effectively recognize and apply core concepts	Precision in core concept recognition and application	Precision	Accuracy	Credibility
341. AI still needs to improve in language processing precision and context understanding	Room for improvement in language processing precision and context understanding	Precision	Accuracy	Credibility
342. AI seems to focus more on grammatical correctness, producing very standard sentences	Grammatical correctness	Precision	Accuracy	Credibility
343. Some textual or visual content appears overly templated	Overly templated content	Template-based	Humanization	Credibility
344. While AI-generated content is often information-rich, it can sometimes feel a bit "formulaic," lacking innovative breakthroughs	Formulaic with lack of innovative breakthroughs	Template-based	Humanization	Credibility
345. AI needs to break free from existing frameworks and truly create new forms and styles of music	Breaking free from existing frameworks to create new forms	Template-based	Humanization	Credibility
346. Currently, AI generation seems constrained by fixed rules and templates. If the flexibility of AI could be adjusted to make it more adaptable in its creations, the generated content might become more creative and personalized	Constrained by fixed rules and templates	Template-based	Humanization	Credibility
347. In the field of literature... offers engaging reading experiences	Reading engagement in literature	Fun/Amusement	Experiential attraction	Attractiveness
348. Sometimes you hear anime characters singing pop songs, which feels particularly fun	Fun of hearing anime characters sing pop songs	Fun/Amusement	Experiential attraction	Attractiveness
349. It's precisely this unpredictability that makes AI-generated content especially interesting	Unpredictable plots adding interest	Fun/Amusement	Experiential attraction	Attractiveness

Raw statement	Initial codes	Core concepts	Subcategory	Main category
350. AI can generate engaging content, particularly in story development and plot settings	Interesting story development and plot settings	Fun/Amusement	Experiential attraction	Attractiveness
351. This kind of visual impact... is truly interesting	Visually impactful and interesting performances	Fun/Amusement	Experiential attraction	Attractiveness
352. This capability is especially evident on short video platforms, where static images are transformed into lively and fun content. Overall, the creative performance is quite satisfying. By imitating and exaggerating originally serious content, AI generates humorous and entertaining videos, creating a strong sense of contrast and visual impact	Vivid and fun performances on short video platforms	Fun/Amusement	Experiential attraction	Attractiveness
353. Seeing animals mimic human expressions and actions, especially with added human-like details, is both amusing and creatively compelling	Fun creativity in animal expressions and actions	Fun/Amusement	Experiential attraction	Attractiveness
354. Take, for example, a cyberpunk-style robot participating in a water-splashing festival. The juxtaposition of completely unrelated elements creates a particularly interesting sense of contrast	Interesting contrast in cyberpunk style	Fun/Amusement	Experiential attraction	Attractiveness
355. Current content emphasizes interactivity and participation, with many works encouraging audiences to interpret or engage in the creative process in their own way	Emphasizing interactivity and participation	Immersion	Affective attraction	Attractiveness
356. It creates a stronger sense of immersion	Enhancing immersion	Immersion	Affective attraction	Attractiveness
357. Especially in gaming and anime, this dynamic processing provides users with a more immersive experience and adds more creativity and appeal to video content	Immersive experience and creative appeal	Immersion	Affective attraction	Attractiveness
358. AI can seamlessly combine elements that would normally never go together	Natural combination of impossible elements	Naturalness	Accuracy	Credibility
359. If these elements could appear more natural and realistic, the effect would be even better	Enhancing naturalness and realism	Naturalness	Accuracy	Credibility
360. It feels like AI has the creativity, but the precision is lacking, making the results sometimes appear unnatural	Creative but not natural enough	Naturalness	Accuracy	Credibility
361. In many AI-generated videos, we still see unnatural phenomena like clipping or fake actions, indicating a lack of refinement in detail handling	Insufficient detail handling for unnatural phenomena	Naturalness	Accuracy	Credibility
362. AI can automatically process a large number of details, making originally distorted images appear more realistic and natural—something traditional techniques cannot match	Automated detail processing for enhanced naturalness and realism	Naturalness	Accuracy	Credibility
363. There's a lack of that natural sense of flow	Lack of natural flow	Naturalness	Accuracy	Credibility
364. However, despite the overall good results, the characteristics of AI generation are still obvious, lacking some natural subtlety	Lacking natural subtlety	Naturalness	Accuracy	Credibility
365. I hope AI-generated content can become more natural	Desire for more natural content	Naturalness	Accuracy	Credibility

Raw statement	Initial codes	Core concepts	Subcategory	Main category
366. If AI could further improve the naturalness of its content, the generated images would appear more realistic and fluid	Enhancing naturalness for greater realism and fluidity	Naturalness	Accuracy	Credibility
367. The most significant difference in AI-generated content lies in its exceptionally rich imagination	Rich imagination	Imagination	Freshness	Originality
368. Presents... imaginative content	Imaginative content	Imagination	Freshness	Originality
369. AI can generate imaginative storylines and character settings	Imaginative storylines and character settings	Imagination	Freshness	Originality
370. Scenes that are unlikely to happen in real life, especially in some fictional contexts, AI-generated content often appears bolder and more imaginative than humans	Bolder and more imaginative in fictional scenarios	Imagination	Freshness	Originality
371. The visuals are particularly imaginative. Things that do not exist in nature can be easily created by AI, which is truly astonishing	Imaginative visuals	Imagination	Freshness	Originality
372. Compared to previously seen content, AI-generated material indeed has a richer imagination	Richer imagination than humans	Imagination	Freshness	Originality
373. AI can combine imagination and reality in a particularly vivid way	Vivid combination of imagination and reality	Imagination	Freshness	Originality
374. This method of blending the virtual and reality not only breaks our inherent perceptions but also makes seemingly impossible scenes tangible, full of imagination	Imagination blending virtual and reality	Imagination	Freshness	Originality
375. I think the biggest difference in AI-generated content is its more unbridled and imaginative nature	Unbridled imagination	Imagination	Freshness	Originality
376. It can combine various impossible elements in the same frame, making it feel both unfamiliar and fresh	Imagination combining impossible elements	Imagination	Freshness	Originality
377. AI can easily merge different elements to create many scenes that are hard for us to imagine in daily life	Creating hard-to-imagine scenes	Imagination	Freshness	Originality
378. Although AI-generated actions already have high mimicry capabilities, if they could be bolder and explore more imaginative action designs, they would be more visually impactful and creative	Exploring more imaginative action designs	Imagination	Freshness	Originality
379. Structurally complete articles	Structurally complete articles	Completeness	Structural integrity	Credibility
380. Relatively appropriate content, also structurally complete	Relatively appropriate and structurally complete	Completeness	Structural integrity	Credibility
381. AI-generated articles are particularly complete in structure and clear in logic	Particularly complete and clear structure	Completeness	Structural integrity	Credibility
382. Its performance is more on practicality rather than being groundbreaking	More practical than groundbreaking	Usefulness	Value depth	Depth
383. Generated charts often have clear structures and straightforward information, helping us quickly understand complex data... particularly useful in data analysis and reporting scenarios	Clear chart structures and information aiding understanding	Usefulness	Value depth	Depth

Raw statement	Initial codes	Core concepts	Subcategory	Main category
384. AI can utilize data more deeply to generate content more suited to specific scenarios or needs, especially when dealing with complex topics, allowing creativity not just to stay at the visual level but also to convey more specific information and meanings	Content more suited to specific scenarios or needs	Usefulness	Value depth	Depth
385. If AI can further enhance the understanding of user needs and customized processing, making the generated content more aligned with personalized user requirements, then its creative performance will be more in line with actual needs, enhancing user experience	Enhanced understanding and customized processing to meet actual needs	Usefulness	Value depth	Depth
386. AI-generated text content is quite effective and efficient	Effective and efficient text content generation	Usefulness	Value depth	Depth
387. AI-generated content is more aligned with actual needs, and this dynamic modification capability greatly enhances the practicality and creative performance of the content	More aligned with actual needs enhancing practicality and creative performance	Usefulness	Value depth	Depth
388. This ability to combine text and images is very practical	Practical ability to combine text and images	Usefulness	Value depth	Depth
389. AI-generated content performs poorly in practicality, with low usability of generated text and lacking distinct creative traits	Poor practicality lacking creative traits	Usefulness	Value depth	Depth
390. AI-generated images have vibrant color matching and rich content, accurately fitting the set theme	Vibrant color matching in images fitting the theme	Alignment with theme	Value depth	Depth
391. The colors, poses of the subjects, and background configurations all fit the theme well	Subject colors, poses, and background configurations fitting the theme	Alignment with theme	Value depth	Depth

Appendix B

The Penguin and the Polar Bear

《企鹅与北极熊》企鹅闯进北极熊开的寿司店:“老板,来份三文鱼刺身,要零下50度急冻的!”

北极熊:“本店只做常温寿司。”企鹅掏出一把冰锥拍在桌上:“现在有了。”突然店外传来轰隆声——五十只企鹅开着破冰船撞碎墙壁:“老大!南极洲外送队已就位,保证食材新鲜度-50°C!”
